\*1 T, ST, and C cannot be used.

## Processing details

A value specified in (s3) is written to a parameter (s2) in an inverter connected to the communication channel (n) whose station number is (s1). For details, refer to  MELSEC iQ-F FX5 User's Manual (Communication). (For the parameter numbers, refer to the each inverter manual.)

## Precautions

Three devices are occupied from the device specified in (d). Make sure that these devices are not used in other controls.

## Operation error

\*1 T, ST, and C cannot be used.

## Processing details

A data table specified in (s2) and (s3) is written to an inverter connected to the communication channel (n) whose station number is (s1) in batch. For details, refer to  MELSEC iQ-F FX5 User's Manual (Communication). (For the parameter numbers, refer to the each inverter manual.)

## Precautions

Three devices are occupied from the device specified in (d). Make sure that these devices are not used in other controls.

## Operation error

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes multiple commands of an inverter connected to the communication channel (n) whose station number is specified in (s1). Specify the send/receive data type using (s2), the head device which stores data to be written to the inverter using (s3), and the head device which stores values to be read from the inverter using (d1). For details, refer to [MELSEC iQ-F FX5 User's Manual \(Communication\)](#).

## Precautions

- If a device number outside the range due to indexing, etc. is specified in (d1), the receive data from the inverter is not stored in (d1). However, values set in (s3) and (s3)+1 may be written to the inverter.
- If any unspecified value is set in (s2), unexpected data may be written to and read from the inverter, and values of (d1) and (d1)+1 may be updated.
- The IVMC instruction reads the inverter status at the time of communication with the inverter, and stores it in (d1). Accordingly, the inverter status written by the IVMC instruction can be read when the next reading instruction (IVCK, IVMC, etc.) is executed.
- Two devices are occupied from the device specified in (s3) and (d1). Make sure that these devices are not used in other controls.
- Three devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For communication errors, refer to [MELSEC iQ-F FX5 User's Manual \(Communication\)](#).

# 17.3 MODBUS Communication Instruction

## ADPRW [using six operands]

FX5S

FX5UJ

FX5U

FX5UC

This instruction allows the MODBUS Master to communicate (read/write data) with the Slaves.

This instruction is used when the master station has only one channel. (This instruction cannot be used with ADPRW [using eight operands].)

| Ladder diagram | Structured text                     |

| (s5)/(d1) | ○                           | ○ <sup>*1</sup>           | ○     | ○ | —           | —  | ○                      | ○        | — | —  | —      |
| (d2)      | ○                           | ○ <sup>*1</sup>           | —     | — | —           | —  | —                      | —        | — | —  | —      |

\*1 T, ST, and C cannot be used.

## Processing details

- Function code (s2) is operated on Slave station No. (s1) according to Parameters (s3), (s4), and (s5)/(d1). Use 0 as the Slave station No. for Broadcast commands. For details, refer to  MELSEC iQ-F FX5 User's Manual (Communication).
- The communication execution status (d2) is output according to the status of the ADPRW instruction such as communicating/completed normally/completed with an error.

## Precautions

Three devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                       |

| 3100H                      | Instructions that cannot be used with each other are programmed at the same time. |

For communication errors, refer to  MELSEC iQ-F FX5 User's Manual (Communication).

## ADPRW [using eight operands]

FX5S

FX5UJ

FX5U

FX5UC

This instruction allows the MODBUS Master to communicate (read/write data) with the Slaves.

This instruction can be used on master stations with up to four channels. (This instruction cannot be used with ADPRW [using six operands].)

| Ladder diagram | Structured text                          |
|----------------|------------------------------------------|
|                | ENO:=ADPRW_8(EN,s1,s2,s3,s4,s5,d1,d2,n); |
| FBD/LD         |                                          |
|                |                                          |

\*1 T, ST, and C cannot be used.

## Processing details

- Function code (s2) is operated on Slave station No. (s1) according to Parameters (s3), (s4), (s5), and (d1). Use 0 as the Slave station No. for Broadcast commands. For details, refer to MELSEC iQ-F FX5 User's Manual (Communication).
- The communication execution status (d2) is output according to the status of the ADPRW instruction such as communicating/completed normally/completed with an error.

## Precautions

Three devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

## Operation error

| Error code (SD0/SD8067) | Description                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For communication errors, refer to MELSEC iQ-F FX5 User's Manual (Communication).

# 17.4 Predefined Protocol Support Function Instruction

17

## S(P).CPRTCL

**FX5S** **FX5UJ** **FX5U** **FX5UC**

This instruction executes the communication protocol registered using the engineering tool.

| (s)+0  | Completion status                          | The completion status is stored upon completion of the instruction.<br>When two or more protocols are executed, the execution result of the protocol executed last is stored.<br>0: Normal completion<br>Other than 0: Error completion (error code)                                                                                                                             | —             | System               |
| (s)+1  | Resulting number of executed protocols     | The number of protocols executed by the S(P).CPRTCL instruction is stored.<br>Any protocol where an error occurred is also included in the execution number.<br>If the setting of setting data or control data contains an error, "0" is stored.                                                                                                                                 | 0, 1 to 8     | System               |
| (s)+2  | Execution protocol number 1                | Specify the number of the protocol to be executed first.                                                                                                                                                                                                                                                                                                                         | 1 to 64       | User                 |
| (s)+3  | Execution protocol number 2                | Specify the number of the protocol to be executed second.                                                                                                                                                                                                                                                                                                                        | 0, 1 to 64    |                      |
| (s)+4  | Execution protocol number 3                | Specify the number of the protocol to be executed third.                                                                                                                                                                                                                                                                                                                         | 0, 1 to 64    |                      |
| (s)+5  | Execution protocol number 4                | Specify the number of the protocol to be executed fourth.                                                                                                                                                                                                                                                                                                                        | 0, 1 to 64    |                      |
| (s)+6  | Execution protocol number 5                | Specify the number of the protocol to be executed fifth.                                                                                                                                                                                                                                                                                                                         | 0, 1 to 64    |                      |
| (s)+7  | Execution protocol number 6                | Specify the number of the protocol to be executed sixth.                                                                                                                                                                                                                                                                                                                         | 0, 1 to 64    |                      |
| (s)+8  | Execution protocol number 7                | Specify the number of the protocol to be executed seventh.                                                                                                                                                                                                                                                                                                                       | 0, 1 to 64    |                      |
| (s)+9  | Execution protocol number 8                | Specify the number of the protocol to be executed eighth.                                                                                                                                                                                                                                                                                                                        | 0, 1 to 64    |                      |
| (s)+10 | Collation match<br>Receive packet number 1 | If receiving is included in the communication type of the protocol that has been executed first, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the first protocol, "0" is stored.                                                                        | 0, 1 to 16    | System               |
| (s)+11 | Collation match<br>Receive packet number 2 | If receiving is included in the communication type of the protocol that has been executed second, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the second protocol, "0" is stored. If the number of protocols executed is less than 2, "0" is stored.   | 0, 1 to 16    |                      |
| (s)+12 | Collation match<br>Receive packet number 3 | If receiving is included in the communication type of the protocol that has been executed third, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the third protocol, "0" is stored. If the number of protocols executed is less than 3, "0" is stored.     | 0, 1 to 16    |                      |
| (s)+13 | Collation match<br>Receive packet number 4 | If receiving is included in the communication type of the protocol that has been executed fourth, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the fourth protocol, "0" is stored. If the number of protocols executed is less than 4, "0" is stored.   | 0, 1 to 16    |                      |
| (s)+14 | Collation match<br>Receive packet number 5 | If receiving is included in the communication type of the protocol that has been executed fifth, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the fifth protocol, "0" is stored. If the number of protocols executed is less than 5, "0" is stored.     | 0, 1 to 16    |                      |
| (s)+15 | Collation match<br>Receive packet number 6 | If receiving is included in the communication type of the protocol that has been executed sixth, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the sixth protocol, "0" is stored. If the number of protocols executed is less than 6, "0" is stored.     | 0, 1 to 16    |                      |
| (s)+16 | Collation match<br>Receive packet number 7 | If receiving is included in the communication type of the protocol that has been executed seventh, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the seventh protocol, "0" is stored. If the number of protocols executed is less than 7, "0" is stored. | 0, 1 to 16    |                      |
| (s)+17 | Collation match<br>Receive packet number 8 | If receiving is included in the communication type of the protocol that has been executed eighth, the receive packet number successful in collation match is stored. If the communication type is "receive only", "0" is stored. If an error occurs during execution of the eighth protocol, "0" is stored. If the number of protocols executed is less than 8, "0" is stored.   | 0, 1 to 16    |                      |

<sup>\*1</sup> User: Data to be set before the execution of the instruction. System: The CPU module stores the execution result of the instruction.

## Processing details

This instruction executes the protocol registered using the engineering tool. Using CH specified by (n1), the instruction executes the protocol in accordance with the control data stored in the device specified by (s) and later. The instruction continuously executes as many protocols as specified by (n2) (a maximum of 8 protocols) at one time.

The number of executed protocols is stored in the device specified by (s)+1.

The completion of the S(P).CPRTCL instruction can be checked using the completion devices (d)+0 and (d)+1.

- Completion device (d)+0: Turns ON during the END processing for the scan in which the S(P).CPRTCL instruction is completed, and turns OFF during the next END processing.
- Completion device (d)+1: Turns ON or OFF depending on the status when the S(P).CPRTCL instruction is completed.

| Status                       | Description                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| When completed normally      | The device does not change (remains OFF).                                                                                                                   |
| When completed with an error | The device turns ON during the END processing for the scan in which the S(P).CPRTCL instruction is completed, and turns OFF during the next END processing. |

For details, refer to [MELSEC iQ-F FX5 User's Manual \(Communication\)](#).

## Precautions

- If an error occurs in the mth protocol while multiple protocols are being executed, the instruction does not execute the "m+1"th protocol and after and is completed with an error.
- The communication CH for which the S(P).CPRTCL instruction can be executed are only those for which "Predefined protocol support function" is specified for the communication protocol.
- If a cancel request is received during execution of the mth protocol while multiple protocols are executed continuously, the following is stored in (s).

| Device  | Item                                      | Description                                                                                |
|---------|-------------------------------------------|--------------------------------------------------------------------------------------------|
| (s)+0   | Completion status                         | The error codes.                                                                           |
| (s)+1   | Resulting number of executed protocols    | The executed protocol number.                                                              |
| (s)+10  | Collation match Receive packet number 1   | The receive packet number successful in collation match for the already executed protocol. |
| ⋮       | ⋮                                         |                                                                                            |
| (s)+m+8 | Collation match Receive packet number m-1 |                                                                                            |

- If same instructions are executed for the same CH, the subsequent instruction is ignored and is not executed until the preceding instruction is completed.

For other precautions, refer to [MELSEC iQ-F FX5 User's Manual \(Communication\)](#).

## Operation error

| Error code<br>(SD0/SD8067) | Description                                    |
|----------------------------|------------------------------------------------|
| 2820H                      | The device used exceeded the specified range.  |
| 2821H                      | The device used to store data are overlapping. |
| 2822H                      | Device that cannot be specified is specified.  |
| 3405H                      | The input data was out of range.               |

# 18 POSITIONING INSTRUCTION

## 18.1 Dedicated Instruction (Positioning Function)

18

### Instruction correspondence table for CPU module built-in positioning and high-speed pulse input/output module

The table for instructions corresponding to the CPU module and the high-speed pulse input/output module are shown below.

○: Supported, —: Not supported

# Zero return(OPR) with 16-bit data DOG search

## DSZR [For the FX3 compatible operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes mechanical zero return. Only CPU module is supported.

| (s2)    | ○*1*2                       | ○*5                       | —     | — | —           | —  | —                      | —        | — | —  | —      |
| (d1)    | ○*3                         | —                         | —     | — | —           | —  | —                      | —        | — | —  | —      |
| (d2)    | ○*4                         | ○*5                       | —     | — | —           | —  | —                      | —        | — | —  | —      |

\*1 When using X, always specify a device that has been set by parameter.

\*2 Specify the device set with a parameter or same as the one set in (s1).

\*3 Only Y can be used.

\*4 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*5 T, ST, and C cannot be used.

## Processing details

This instruction executes mechanical zero return. The values of special devices are applied as the zero return speed and creep speed. With the forward limit or reverse limit, zero return with the dog search function can be executed.

- For (s1), specify the near-point dog signal input device number. When an X device is specified, the near-point dog signal functions follow the logic set by parameter. When other than X device is specified, the device functions follow the positive logic.
- For (s2), specify the zero-phase signal input device number. When an X device is specified, the zero-phase signal functions follow the logic set by parameter. When other than X device is specified, the device functions follow the positive logic.
- For (d1), specify the device from which pulses are output. Only the output devices (Y) having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with a parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DSZR [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes mechanical zero return. The near-point dog signal and zero-phase signal function follow the device set with parameters. With the forward limit or reverse limit, zero return with the dog search function can be executed.

- For (s1), specify the zero return speed in the user units. (The speed must be 200 kpps or lower in frequency.)
- For (s2), specify the creep speed in the user units. Set the creep speed equal to or slower than the zero return speed set in (s1). (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number for which zero return is performed.
- For (d2), specify the bit device of the zero return complete flag or abnormal end flag.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# Zero return(OPR) with 32-bit data DOG search

## Processing details

This instruction executes mechanical zero return. The near-point dog signal and zero-phase signal function follow the device set with parameters. With the forward limit or reverse limit, zero return with the dog search function can be executed.

- For (s1), specify the zero return speed in the user units. (The speed must be 200 kpps or lower in frequency.)
- For (s2), specify the creep speed in the user units. Set the creep speed equal to or slower than the zero return speed set in (s1). (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number for which zero return is performed.
- For (d2), specify the bit device of the zero return complete flag or abnormal end flag.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 16-bit data interrupt positioning

## DVIT [For the FX3 compatible operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes interrupt 1-speed constant quantity feed. Only CPU module is supported.

| (d2)    | ○*2                         | ○*3                       | —     | — | —           | —  | —                      | —        | — | —  | —      |

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes interrupt 1-speed constant quantity feed.

- For (s1), specify the transfer distance that is output after an interrupt, in user units. (The distance must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the output devices (Y) having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with a parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DVIT [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes interrupt 1-speed constant quantity feed.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes interrupt 1-speed constant quantity feed.

- For (s1), specify the transfer distance that is output after an interrupt, in user units. (The distance must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the normal complete flag or abnormal end flag for the DVIT instruction.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## 32-bit data interrupt positioning

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes interrupt 1-speed constant quantity feed.

- For (s1), specify the transfer distance that is output after an interrupt, in user units. (The distance must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the output devices (Y) having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with a parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DDVIT [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes interrupt 1-speed constant quantity feed.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes interrupt 1-speed constant quantity feed.

- For (s1), specify the transfer distance that is output after an interrupt, in user units. (The distance must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the normal complete flag or abnormal end flag for the DDVIT instruction.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# Positioning by one table operation

## Processing details

This instruction executes positioning operation set in multiple data tables with the engineering tool in the continuous operation or stepping operation. To execute such operation, this instruction needs to be executed only once.

- For (d1), specify the axis number from which pulses are output.
- For (n1), specify the start table to be executed according to the output specified in (d1).
- For (n2), specify the last table. When (n1) and (n2) are the same, only one table is executed. The table operation keeps executing until the last table or a table that is not set with parameters is executed.
- For (n3), specify the table execution method. (K0 = Stepping operation, K1 = Continuous operation)
- For (d2), specify the bit device of the normal complete flag or abnormal end flag.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# Multiple axes concurrent drive positioning

## DRVMUL

FX5S

FX5UJ

FX5U

FX5UC

This instruction executes tables of multiple axes of one module simultaneously.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes tables of multiple axes of one module simultaneously.

- For (n1), specify the head axis number for which pulses are output.

| Designation number | Axis numbers to be used                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| K1                 | ■FX5S/FX5U/FX5UC CPU module<br>Execute axis 1 to axis 4 (CPU module) simultaneously.<br>■FX5UJ CPU module<br>Execute axis 1 to axis 3 (CPU module) simultaneously. |
| K5                 | Execute axis 5, axis 6 (high-speed pulse input/output module first module) simultaneously.                                                                         |
| K7                 | Execute axis 7, axis 8 (high-speed pulse input/output module second module) simultaneously.                                                                        |
| K9                 | Execute axis 9, axis 10 (high-speed pulse input/output module third module) simultaneously.                                                                        |
| K11                | Execute axis 11, axis 12 (high-speed pulse input/output module fourth module) simultaneously.                                                                      |

- For (n2), specify the table number that is executed with the axis (n1). When not executing the axis (n1), specify K0.
- For (n3), specify the table number that is executed with the axis (n1)+1. When not executing the axis (n1)+1, specify K0.
- For (n4), specify the table number that is executed with the axis (n1)+2. If axis (n1) + 2 is not executed or the axis number of the high-speed pulse input/output module is specified to (n1), specify K0.
- For (n5), specify the table number that is executed with the axis (n1)+3. If axis (n1)+3 is not executed or the axis number of the FX5S/FX5UJ CPU module or high-speed pulse input/output module is specified to (n1), specify K0.
- For (d), specify the device<sup>\*1</sup> of the instruction execution complete flag for each axis. Each device functions as the following flag.

| Device | Description                                                               |
|--------|---------------------------------------------------------------------------|
| (d)    | Instruction execution complete flag for the axis (n1)                     |
| (d)+1  | Instruction execution abnormal end flag for the axis (n1)                 |
| (d)+2  | Instruction execution complete flag for the axis (n1)+1                   |
| (d)+3  | Instruction execution abnormal end flag for the axis (n1)+1               |
| (d)+4  | Instruction execution complete flag for the axis (n1)+2                   |
| (d)+5  | Instruction execution abnormal end flag for the axis (n1)+2               |
| (d)+6  | Instruction execution complete flag for the axis (n1)+3 <sup>*2</sup>     |
| (d)+7  | Instruction execution abnormal end flag for the axis (n1)+3 <sup>*2</sup> |

\*1 The following number of device points are occupied starting with (d).

FX5S/FX5UJ CPU module: 6 points

FX5U/FX5UC CPU module: 8 points

\*2 The complete flag is assigned only in FX5U/FX5UC CPU module.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Make sure that the instruction execution complete flag and devices used with other controls are not duplicated.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 32-bit data ABS current value read

## DABS

FX5S

FX5UJ

FX5U

FX5UC

This instruction reads the absolute position (ABS) data when a servo amplifier (equipped with the absolute position detection function) is connected. The data is converted into pulse when read.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction reads the absolute position (ABS) data when a servo amplifier (equipped with the absolute position detection function) is connected. The data is converted into pulse when being read.

- For (s), specify the head device number that inputs the output signal for absolute position (ABS) data from the servo amplifier.
- For (d1), specify the head device number that outputs the absolute position (ABS) data control signal to the servo amplifier.  
Be sure to use transistor outputs for the CPU module outputs.
- For (d2), specify the device that stores the absolute position (ABS) data read from the servo amplifier.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Three devices are occupied from the device specified in (s) and (d1). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 16-bit data variable speed pulse

## PLSV [For the FX3 compatible operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction outputs variable speed pulses with an assigned rotation direction output. Only CPU module is supported.

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction outputs variable speed pulses with an assigned rotation direction output.

- For (s), specify the command speed to be output. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the output devices (Y) having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with the parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## PLSV [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction outputs variable speed pulses with an assigned rotation direction output.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction outputs variable speed pulses with an assigned rotation direction output.

- For (s), specify the command speed to be output. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the abnormal end flag for the PLSV instruction. (This device does not have the normal complete status, and only has the abnormal end status ((d2)+1).

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 32-bit data variable speed pulse

| (d2)    | ○*2                         | ○*3                       | —     | — | —           | —  | —                      | —        | — | —  | —      |

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by incremental drive. Specify the positioning address in the incremental system, in which the transfer direction and transfer distance from the current position (relative address) are specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the Y devices having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with the parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DRVI [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes one-speed positioning by incremental drive.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by incremental drive. Specify the positioning address in the incremental system, in which the transfer direction and transfer distance from the current position (relative address) are specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the normal complete flag or abnormal end flag for the DRVI instruction.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 32-bit data relative positioning

## DDRVI [For the FX3 compatible operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes one-speed positioning by incremental drive. Only CPU module is supported.

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by incremental drive. Specify the positioning address in the incremental system, in which the transfer direction and transfer distance from the current position (relative address) are specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the Y devices having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with the parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DDRVI [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes one-speed positioning by incremental drive.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by incremental drive. Specify the positioning address in the incremental system, in which the transfer direction and transfer distance from the current position (relative address) are specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the normal complete flag or abnormal end flag for the DDRVI instruction.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 16-bit data absolute positioning

## DRVA [For the FX3 compatible operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes one-speed positioning by absolute drive. Only CPU module is supported.

| (d2)    | ○*2                         | ○*3                       | —     | — | —           | —  | —                      | —        | — | —  | —      |

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by absolute drive. Specify the positioning address in the absolute system, in which the transfer distance from the origin (absolute address) is specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the Y devices having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with the parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DRVA [For the FX5 operand specification]

FX5S

FX5UJ

FX5U

FX5UC

This instruction executes one-speed positioning by absolute drive.

\*1 Only Y can be used.

\*2 When the output mode is CW/CCW, specify the CCW axis. When the output mode is PULSE/SIGN and using Y, only the SIGN output or general-purpose output of the self-axis can be specified.

\*3 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by absolute drive. Specify the positioning address in the absolute system, in which the transfer distance from the origin (absolute address) is specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the device from which pulses are output. Only the Y devices having positioning parameters can be specified.
- For (d2), specify the bit device from which the rotation direction signal is output. Only the device specified with the parameter or general-purpose outputs can be specified. When the output devices (Y) is executed by another function (PWM, positioning PULSE axis, or CW/CCW axis etc.), the device does not function and causes an error.

For details on the function, precautions, and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## DDRVA [For the FX5 operand specification]

**FX5S**

**FX5UJ**

**FX5U**

**FX5UC**

This instruction executes one-speed positioning by absolute drive.

\*1 T, ST, and C cannot be used.

## Processing details

This instruction executes one-speed positioning by absolute drive. Specify the positioning address in the absolute system, in which the transfer distance from the origin (absolute address) is specified for positioning.

- For (s1), specify the relative positioning address in user units. (The address must be within the range of -2147483648 to +2147483647 in the number of pulses.)
- For (s2), specify the command speed in user units. (The speed must be 200 kpps or lower in frequency.)
- For (d1), specify the axis number from which pulses are output.
- For (d2), specify the bit device of the normal complete flag or abnormal end flag for the DDRVA instruction.

For details on the function and error code, refer to  MELSEC iQ-F FX5 User's Manual (Application).

## Precautions

Two devices are occupied from the device specified in (d2). Make sure that these devices are not used in other controls.

For other precautions, refer to  MELSEC iQ-F FX5 User's Manual (Application).

# 18.2 Positioning Module

## Restoring the absolute position

### G.ABRST□

**FX5S****FX5UJ****FX5U****FX5UC**

These instructions restore the absolute position of the specified axis.

## Processing details

- The positioning data of the following axis is read from the servo amplifier supporting the absolute position and the value with the unit converted is stored in the "Current feed value" and "Machine feed value" areas in the positioning module. For the absolute position detection system, restore the absolute position once when it is powered on or the CPU module is reset.

| Instruction symbol | Target axis |
|--------------------|-------------|
| G.ABRST1           | Axis 1      |
| G.ABRST2           | Axis 2      |

- The following figure shows how the G.ABRST□ instruction operates.

\*1 The CPU module input/output can also be used.

- For communication with the servo amplifier corresponding to the absolute position (data read/write), the input/output of CPU module or the I/O module is used. To use the G.ABRST□ instruction, prepare the following number of points to communicate with servo amplifier per axis.

- Input: 3 points
- Output: 3 points

- Whether the execution of the G.ABRST□ instruction has been completed normally or with an error can be checked with the completion device (d) or completion status indication device (d)+1.

| Device                                    | Description                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion device (d)                     | This device turns on during the END processing of the scan where the G.ABRST□ instruction completed, and turns off during the next END processing.                                                                                                                                                                  |
| Completion status indication device (d)+1 | This device turns on or off depending on the completion status of the G.ABRST□ instruction.<br>When completed normally: Unchanged from off.<br>When completed with an error: Turns on during the END processing of the scan where the G.ABRST□ instruction completed, and turns off during the next END processing. |

- The following figure shows the operation at completion of the G.ABRST□ instruction.

- Completion of absolute position restoration can be checked with the (s)+4 status.
- The G.ABRST□ instruction performs absolute position restoration by following procedure.

#### 1. Output data from ((s)+3).

Servo on, ABS transfer mode, and ABS request flag are output by using the program.

#### 2. Set data in ((s)+2).

ABS data bit 0/bit 1 and the send data ready flag are set using the program.

#### 3. Execute the G.ABRST□ instruction.

#### 4. Check whether the value in ((s)+4) is 0 or not.

When the value is other than 0, the processing returns to step 1.

When the value is 0, the processing ends.

- For details of the function, refer to MELSEC iQ-F FX5 Positioning Module User's Manual.

## Precautions

- If the absolute position detection system has been constructed, absolute position restoration must be performed once after the power is turned on or reset. The servo does not turn on until the absolute position restoration completes.
- Absolute position restoration must be performed while the [Cd.190] PLC READY signal is off. While [Cd.190] PLC READY signal is ON, if the G.ABRST□ instruction is executed, "Dedicated instruction error (Error code: 1870H)" occurs in the positioning module and absolute position restoration cannot be executed.
- The absolute position can be restored (the G.ABRST□ instruction can be executed) while a servo amplifier is operable. Note that when the absolute position is restored, the Servo on signal may turn off (servo off) for the period of the scan time plus approximately 60 ms and the motor may move. To restore the absolute position during the servo off state, install an electromagnetic brake separately so that signals are output to the electromagnetic brake while the G.ABRST□ instruction is being executed.
- The following instructions cannot be executed simultaneously to a single axis. For different axes, any of the following can be executed concurrently with a G.ABRST□ instruction.
  - Positioning start instruction (GP.PSTRT□)
  - Absolute position restoration instruction (G.ABRST□)
  - Teaching instruction (GP.TEACH□)
- If this instruction is executed in an interrupt program with the priority 1, operation error (3580H) occurs. This instruction operates in an interrupt program with the priority 2 or 3.

## Operation error

| Error code<br>((s)+1) | Description                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1860H                 | A value other than 0 was set in "Status" of (s)+4 (at start of communication with the servo amplifier).                  |
| 1861H                 | "Status" of (s)+4 was changed during absolute position restoration (i.e. during communication with the servo amplifier). |
| 1865H                 | An instruction was specified for an undefined axis.                                                                      |

| (s)+2  | Start number      | Specifies the number of the following data that is started with the GP.PSTRT□ instruction.<br>• Positioning data number: 1 to 600<br>• Block start: 7000 to 7004<br>• Machine OPR: 9001<br>• Fast OPR: 9002<br>• Present value change: 9003<br>• Multiple axes concurrent start: 9004 | 1 to 600<br>7000 to 7004<br>9001 to 9004 | User   |

## Processing details

- The positioning is started for the specified axes below.

| Instruction symbol | Target axis |
|--------------------|-------------|
| GP.PSTRT1          | Axis 1      |
| GP.PSTRT2          | Axis 2      |

- Block start, origin return start, present value change start, and multiple axes concurrent start are available by specifying one of 7000 to 7004 or 9001 to 9004 with "Start number" in (s)+2.
- Whether the GP.PSTRT□ instruction has been completed normally or with an error can be checked with the completion device (d) or completion status indication device (d)+1.

| Device                                    | Description                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion device (d)                     | This device turns on during the END processing of the scan where the GP.PSTRT□ instruction completed, and turns off during the next END processing.                                                                                                                                                                   |
| Completion status indication device (d)+1 | This device turns on or off depending on the completion status of the GP.PSTRT□ instruction.<br>When completed normally: Unchanged from off.<br>When completed with an error: Turns on during the END processing of the scan where the GP.PSTRT□ instruction completed, and turns off during the next END processing. |

- The following figure shows the operation at completion of the GP.PSTRT□ instruction.

- For details of the function, refer to MELSEC iQ-F FX5 Positioning Module User's Manual.

## Precautions

- If the positioning is started by using the GP.PSTRTO instruction, the [Cd.184] Positioning start signal will not turn on. In this case, although the start completion signals ([Md.31] Status: b14) turn on, the ON time is short; the program may fail to detect the ON state. For this reason, start completion cannot be checked using the start completion signals ([Md.31] Status: b14). Check the positioning control status with the start command of the GP.PSTRTO instruction or the [Md.141] BUSY signal.
- If the positioning is started by using the GP.PSTRTO instruction, and then the stop command is input before the positioning completes, the completion device (d) turns on for one scan and the execution of the GP.PSTRTO instruction completes.
- The following instructions cannot be executed simultaneously to a single axis. For different axes, any of the following can be executed concurrently with a GP.PSTRTO instruction.
  - Positioning start instruction (GP.PSTRTO)
  - Absolute position restoration instruction (G.ABRSTO)
  - Teaching instruction (GP.TEACHO)
- The GP.PSTRTO instruction can be executed when the READY signal ([Md.140] module status: b0) is ON. While the READY signal ([Md.140] module status: b0) is OFF, if the GP.PSTRTO instruction is executed, "PLC READY OFF start (Error code: 19A1H)" error occurs and positioning cannot be started. Turn the "[Cd.190] PLC READY signal" ON, and turn the READY signal ([Md.140] module status: b0) ON before executing the GP.PSTRTO instruction.
- If multiple axes concurrent start is executed using the GP.PSTRTO instruction, the completion device (d) turns on when the positioning completes for the axis where the GP.PSTRTO instruction has been executed (e.g. Axis 1 for GP.PSTRTO1).
- If the GP.PSTRTO instruction is used, the starting time will delay 0 to 0.88ms relative to the [Cd.184] Positioning start signal.
- If this instruction is executed in an interrupt program with the priority 1, operation error (3580H) occurs. This instruction operates in an interrupt program with the priority 2 or 3.

## Operation error

| Error code<br>((s)+1) | Description                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------|
| 1862H                 | A value other than 1 to 600, 7000 to 7004, or 9001 to 9004 was set in "Starting number" of (s)+2. |
| 1865H                 | An instruction was specified for an undefined axis.                                               |
| 19A1H                 | Start positioning when the "[Cd.190] PLC READY signal" is OFF.                                    |

# Teaching

## GP.TEACH□

| (s)+3  | Positioning data number | Sets the positioning data number at which to perform the teaching.                                                                                                                                                     | 1 to 600      | User   |

## Processing details

- The data of "[Md.20] Current feed value" of one of the following target axes is set in the positioning or arc address. The positioning data other than the positioning or arc address must be set using the engineering tool or program.

| Instruction symbol | Target axis |
|--------------------|-------------|
| GP.TEACH1          | Axis 1      |
| GP.TEACH2          | Axis 2      |

- Positioning data No.1 to 600 can be taught.
- To move to an address (position) to be set as the positioning or arc address of the positioning data, JOG, inching, or manual pulse operation is used.
- Whether the GP.TEACH□ instruction has been completed normally or with an error can be checked with the completion device (d) or completion status indication device (d)+1.

| Device                                    | Description                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion device (d)                     | This device turns on during the END processing of the scan where the GP.TEACH□ instruction completed, and turns off during the next END processing.                                                                                                                                                                   |
| Completion status indication device (d)+1 | This device turns on or off depending on the completion status of the GP.TEACH□ instruction.<br>When completed normally: Unchanged from off.<br>When completed with an error: Turns on during the END processing of the scan where the GP.TEACH□ instruction completed, and turns off during the next END processing. |

- The following figure shows the operation at completion of the GP.TEACH□ instruction.

- For details of the function, refer to MELSEC iQ-F FX5 Positioning Module User's Manual.

## Precautions

- The following instructions cannot be executed simultaneously to a single axis. For different axes, any of the following can be executed concurrently with a GP.TEACH<sub>0</sub> instruction.
  - Positioning start instruction (GP.PSTRT<sub>0</sub>)
  - Absolute position restoration instruction (G.ABRST<sub>0</sub>)
  - Teaching instruction (GP.TEACH<sub>0</sub>)
- The GP.TEACH<sub>0</sub> instruction is executed when "[Md.141] BUSY signal" is off. While "[Md.141] BUSY signal" is ON, if the GP.TEACH<sub>0</sub> instruction is executed, "Teaching during BUSY (Warning code: 0903H)" warning occurs in the positioning module and teaching cannot be executed. Before executing the instruction, check that the "[Md.141] BUSY signal" of the corresponding axis is off.
- If this instruction is executed in an interrupt program with the priority 1, operation error (3580H) occurs. This instruction operates in an interrupt program with the priority 2 or 3.

## Operation error

| Error code<br>(s)+1 | Description                                                                |
|---------------------|----------------------------------------------------------------------------|
| 1863H               | A value other than 0 or 1 was set in "Teaching data selection" of (s)+2.   |
| 1864H               | A value other than 1 to 600 was set in "Positioning data number" of (s)+3. |
| 1865H               | An instruction was specified for an undefined axis.                        |

# Backing up module data (writing data to the flash ROM)

## GP.PFWRT

FX5S

FX5UJ

FX5U

FX5UC

This instruction writes the module extension parameter (the positioning data and block start data) in the buffer memory to the module extension parameter file.

| (s)+1  | Completion status | The instruction completion status is stored.<br>• 0: Normal<br>• Other than 0: Error (error code) | —             | System |

## Processing details

- The buffer memory module extension parameters are written to the module extension parameter file.
- Whether the GP.PFWRT instruction has been completed normally or with an error can be checked with the completion device (d) or completion status indication device (d)+1.

| Device                                    | Description                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion device (d)                     | This device turns on during the END processing of the scan where the GP.PFWRT instruction completed, and turns off during the next END processing.                                                                                                                                                                  |
| Completion status indication device (d)+1 | This device turns on or off depending on the completion status of the GP.PFWRT instruction.<br>When completed normally: Unchanged from off.<br>When completed with an error: Turns on during the END processing of the scan where the GP.PFWRT instruction completed, and turns off during the next END processing. |

- The following figure shows the operation at completion of the GP.PFWRT instruction.

- For details of the function, refer to [MELSEC iQ-F FX5 Positioning Module User's Manual](#).

## Precautions

- While the module extension parameters are being written by using the GP.PFWRT instruction, do not power off the system or reset the CPU module. If the power is turned off or the CPU module is reset while the module extension parameters are being written, data is not normally written and normal positioning start is disabled. If normal positioning start is disabled, restart the system as follows.

| Method                             | Description                                                                                                                                                                                        |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart using the engineering tool | Write the positioning and block start data to the positioning module from the "Write to programmable controller" of the engineering tool.                                                          |
| Restart using the program          | After initializing parameters by using the GP.PINIT instruction, set the module extension parameters in the buffer memory of the positioning module. Thereafter, execute the GP.PFWRT instruction. |

- Data write to the flash ROM of the positioning module can be repeated a maximum of one hundred thousand times. Any attempt to write data to the flash memory beyond this count results in failure, and the flash ROM write error (error code: 1931H) occurs.
- After the power is turned on or the CPU module is reset once, module backup (including the number of times initialization is executed) can be repeated a maximum of 25 times if the program is used. Any attempt to write data to the flash ROM memory beyond 25 times results in a flash ROM write count error at error code 1080H. If this error occurs, reset the positioning module error with "[Cd.5] axis error reset", by turning the power OFF to ON, or by resetting the CPU module.
- The GP.PFWRT instruction can be executed when the READY signal ([Md.140] module status: b0) is OFF. While the READY signal ([Md.140] module status: b0) is ON, if the GP.PFWRT instruction is executed, "Writing during PLC READY ON (Warning code: 0905H) warning occurs in the positioning module and the module backup cannot be executed. Turn the "[Cd.190] PLC READY signal" OFF, and turn the READY signal ([Md.140] module status: b0) OFF before executing the GP.PFWRT instruction.
- If this instruction is executed in an interrupt program with the priority 1, operation error (3580H) occurs. This instruction operates in an interrupt program with the priority 2 or 3.

## Operation error

| Error code ((s)+1) | Description                 |
|--------------------|-----------------------------|
| 1080H              | Flash ROM write count error |
| 1931H              | Flash ROM write error       |

# Initializing the Module

## GP.PINIT

FX5S

FX5UJ

FX5U

FX5UC

This instruction resets the module parameter and module extension parameter (the positioning data and block start data) in the buffer memory, and the module extension parameter file setting values to the factory default settings (initial values).

## Processing details

- These instructions reset the module parameters and module extension parameters in the buffer memory of the positioning module, and the settings in the module extension parameter file to the factory default settings (initial values).
- The setting data initialized include the parameters, positioning data (No. 1 to 600), and block start data (No. 7000 to 7004).
- Whether the GP.PINIT instruction has been completed normally or with an error can be checked with the completion device (d) or completion status indication device (d1)+1.

| Device                                     | Description                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Completion device (d)                      | This device turns on during the END processing of the scan where the GP.PINIT instruction completed, and turns off during the next END processing.                                                                                                                                                                  |
| Completion status indication device (d1)+1 | This device turns on or off depending on the completion status of the GP.PINIT instruction.<br>When completed normally: Unchanged from off.<br>When completed with an error: Turns on during the END processing of the scan where the GP.PINIT instruction completed, and turns off during the next END processing. |

- The following figure shows the operation at completion of the GP.PINIT instruction.

- For details of the function, refer to MELSEC iQ-F FX5 Positioning Module User's Manual.

## Precautions

- The GP.PINIT instruction can be executed when the READY signal ([Md.140] module status: b0) is OFF. While the READY signal ([Md.140] module status: b0) is ON, if the GP.PINIT instruction is executed, "Writing during PLC READY ON (Warning code: 0905H) warning occurs in the positioning module and the initializing the module cannot be executed. Turn the "[Cd.190] PLC READY signal" OFF, and turn the READY signal ([Md.140] module status: b0) OFF before executing the GP.PINIT instruction.
- Data write to the flash ROM of the positioning module can be repeated a maximum of one hundred thousand times. Any attempt to write data to the flash memory beyond this count results in failure, and the flash ROM write error (error code: 1931H) occurs.
- After the power is turned on or the CPU module is reset once, module backup (including the number of times initialization is executed) can be repeated a maximum of 25 times if the program is used. Any attempt to write data to the flash ROM memory beyond 25 times results in a flash ROM write count error at error code 1080H. If this error occurs, reset the positioning module error with "[Cd.5] axis error reset", by turning the power OFF to ON, or by resetting the CPU module.
- If this instruction is executed in an interrupt program with the priority 1, operation error (3580H) occurs. This instruction operates in an interrupt program with the priority 2 or 3.

## Operation error

| Error code<br>((s)+1) | Description                 |
|-----------------------|-----------------------------|
| 1080H                 | Flash ROM write count error |
| 1931H                 | Flash ROM write error       |

| (n1)    | ○                           | ○                         | ○     | ○ | —           | —  | ○                      | ○        | — | —  | —      |
| (n2)    | ○                           | ○                         | ○     | ○ | —           | —  | ○                      | ○        | — | —  | —      |

## Processing details

- This instruction reads (n1) points of buffer memory starting from (s) inside the intelligent function module number (U/H) to (d) in the CPU module. When (n1) exceeds 64 points, it divides and reads by several scans. (64 points are read in one scan)

- When this instruction is finished normally, instruction execution complete flag (SM8029) turns on. When this instruction is finished abnormally, instruction execution abnormal end flag (SM8329) turns on.
- When this instruction or the WBFM instruction is executed in the same scan, instruction non-execution flag (SM8328) is set to on, and execution of such an instruction is paused. When execution of the other target instruction is complete, the paused instruction resumes.

## Related devices

| Device | Name                               | Description                                                                                                    |
|--------|------------------------------------|----------------------------------------------------------------------------------------------------------------|
| SM8029 | Instruction execution complete     | Turns ON when an instruction is finished normally.                                                             |
| SM8328 | Instruction non-execution          | Turns ON when the RBFM instruction or WBFM instruction in another step is executed for the same module number. |
| SM8329 | Instruction execution abnormal end | Turns ON when an instruction is finished abnormally.                                                           |

## Precautions

- Do not stop the instruction while it is being executed. If driving is stopped, the buffer memory reading processing is suspended, but the data that is already read is stored in (d) onwards. Stop the instruction after execution completes as in the following program.

- When indexing is executed, the contents of index registers at the beginning of execution are used. Even if the contents of index registers are changed after the instruction, such changes do not affect the process of the instruction.
- The contents of (n1) points starting from (d) update (change) every scan while this instruction is executed. Use the data after the instruction is completed.
- Do not update (change) the contents of (n1) buffer memory areas starting from the buffer memory (s) while this instruction is executed. If the contents are updated, the intended data may not be read.
- This instruction cannot be used in FX5 intelligent function modules.
- This instruction cannot be used while a interrupt routine program is being executed.

## Operation error

| 3580H                      | An instruction that cannot be used in an interrupt program is used.                                                                   |

## Common items between RBFM instruction and WBFM instruction

### ■ Specification of module number of FX3 intelligent function module and buffer memory

For FX3 intelligent function module connection method, number of connectable FX3 intelligent function modules and handling of I/O numbers, refer to manuals of the CPU module and FX3 intelligent function modules.

- Module number of FX3 intelligent function module

Use the module number to specify for which equipment the RBFM/WBFM instruction is used. (Setting range: 1H to 10H (K1 to K16))

|            |            | Module<br>No. 1             | Module<br>No. 2                   | Module<br>No. 3                   |
|------------|------------|-----------------------------|-----------------------------------|-----------------------------------|
| CPU module | I/O module | Bus<br>conversion<br>module | Intelligent<br>function<br>module | Intelligent<br>function<br>module |

A module number is automatically assigned to each intelligent function module connected to the CPU module. The module number is assigned as No.1 → No.2 → No.3... starting from the equipment nearest the CPU module.

- Buffer memory number

The intelligent function module incorporates a RAM memory. The RAM memory is called buffer memory. Buffer memory numbers range from #0 to #32767 and their contents vary depending on the function of the extension equipment. (Setting range: K0 to K32767)

For the contents of buffer memory areas, refer to manuals of intelligent function modules.

## Program example

In the example shown below, data is read from and written to the buffer memories in the module No. 2 as follows:

- When X0 is set to ON, data stored in D100 to D108 (9 points) is written to the buffer memories #0 to #8 in the FX3 intelligent module whose module number is No. 2.
- When X1 is set to ON, the buffer memories #0 to 91 (92 points) in the FX3 intelligent module whose module number is No. 2 are written to D200 to D291.

# 19.2 Divided BFM Write

## WBFM

This instruction writes data to continuous buffer memory areas in an FX3 intelligent function module.

| Ladder diagram | Structured text                 |

## Processing details

- This instruction writes (n1) points of buffer memory starting from (s1) inside the intelligent function module number (U/H) to (s2) in the CPU module. When (n1) exceeds 64 points, it divides and writes by several scans. (64 points are read in one scan)

- When this instruction is finished normally, instruction execution complete flag (SM8029) turns on. When this instruction is finished abnormally, instruction execution abnormal end flag (SM8329) turns on.
- When this instruction or the RBFM instruction is executed in the same scan, instruction non-execution flag (SM8328) is set to on, and execution of such an instruction is paused. When execution of the other target instruction is complete, the paused instruction resumes.

## Related devices

| Device | Name                               | Description                                                                                                    |
|--------|------------------------------------|----------------------------------------------------------------------------------------------------------------|
| SM8029 | Instruction execution complete     | Turns ON when an instruction is finished normally.                                                             |
| SM8328 | Instruction non-execution          | Turns ON when the RBFM instruction or WBFM instruction in another step is executed for the same module number. |
| SM8329 | Instruction execution abnormal end | Turns ON when an instruction is finished abnormally.                                                           |

## Precautions

- Do not stop the instruction while it is being executed. If driving is stopped, the buffer memory write processing is suspended, but the data that is already written is stored in (s1) onwards.
- When indexing is executed, the contents of index registers at the beginning of execution are used. Even if the contents of index registers are changed after the instruction, such changes do not affect the process of the instruction.
- Do not update (change) the contents of (n1) points starting from (s2) while this instruction is executed. If the contents are updated, the intended data may not be written to the buffer memory areas.
- This instruction cannot be used in FX5 intelligent function modules.
- This instruction cannot be used while a interrupt routine program is being executed.

## Operation error

| Error code (SD0/SD8067) | Description                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 2441H                   | Communication procedure with module is not completed correctly when this instruction is executed.                                 |
| 2801H                   | Module with the module number specified by (U/H) does not exist, or the specified module is not supported.                        |
| 2823H                   | The number of transfer points specified by (n1) and the buffer memory number specified by (s1) is beyond the buffer memory range. |

## 20.1 Converting BOOL to WORD

### BOOL\_TO\_WORD(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert BOOL type data to WORD type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=BOOL_TO_WORD(s);<br>[With EN/ENO]<br>d:=BOOL_TO_WORD_E(EN,ENO,s); |

#### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | BOOL      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(BOOL_TO_WORD(_E)) | Output                                             | Output variable | WORD      |

#### Processing details

#### ■Operation processing

- These functions convert the BOOL type data input to (s) to WORD type data and output from (d).
- When the input value is "FALSE", these functions output 0H as the WORD type data value.
- When the input value is "TRUE", these functions output 1H as the WORD type data value.

- A value input to (s) is the BOOL type data value.

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 20.2 Converting BOOL to DWORD

## BOOL\_TO\_DWORD(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert BOOL type data to DWORD type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                            |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=BOOL_TO_DWORD(s);<br>[With EN/ENO]<br>d:=BOOL_TO_DWORD_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | BOOL      |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(BOOL_TO_DWORD(_E)) | Output                                             | Output variable | DWORD     |

### Processing details

#### ■Operation processing

- These functions convert the BOOL type data input to (s) to DWORD type data and output from (d).
- When the input value is "FALSE", these functions output 0H as the DWORD type data value.
- When the input value is "TRUE", these functions output 1H as the DWORD type data value.

### Processing details

#### ■Operation processing

- These functions convert the BOOL type data input to (s) to TIME type data and output from (d).
- When the input value is "FALSE", these functions output 0 as the TIME type data value.
- When the input value is "TRUE", these functions output 1 as the TIME type data value.

- A value input to (s) is the BOOL type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.6 Converting BOOL to STRING

## BOOL\_TO\_STRING(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert BOOL type data to STRING type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                              |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | DWORD     |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DWORD_TO_BOOL(_E)) | Output                                             | Output variable | BOOL      |

### Processing details

#### ■Operation processing

- These functions convert the DWORD type data input to (s) to BOOL type data and output from (d).
- When the input value is 0H, these functions output "FALSE".
- When the input value is any value other than 0H, these functions output "TRUE".

- A value input to (s) is the DWORD type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.13 Converting DWORD to WORD

## DWORD\_TO\_WORD(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert DWORD type data to WORD type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                            |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=DWORD_TO_WORD(s);<br>[With EN/ENO]<br>d:=DWORD_TO_WORD_E(EN,ENO,s); |
|  |  |                                                                                            |

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | DWORD     |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DWORD_TO_WORD(_E)) | Output                                             | Output variable | WORD      |

### Processing details

#### ■Operation processing

- These functions convert the DWORD type data input to (s) to WORD type data and output from (d).
- The information stored in high-order 16 bits of an input value is discarded. (Refer to (1) in the figure below.)

- A value input to (s) is the DWORD type data value.

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

**Point**

When DWORD\_TO\_WORD(\_E) is executed, the information stored in high-order 16 bits of the DWORD type data value input from (s) is discarded.

Operation error

There is no operation error.

# 20.14 Converting DWORD to INT

## DWORD\_TO\_INT(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert DWORD type data to INT type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|

| Argument           | Description                                        | Type            | Data type |
|--------------------|----------------------------------------------------|-----------------|-----------|
| EN                 | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)              | Input                                              | Input variable  | INT       |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(INT_TO_WORD(_E)) | Output                                             | Output variable | WORD      |

### Processing details

#### ■Operation processing

- These functions convert the INT type data input to (s) to WORD type data and output from (d).

- A value input to (s) is the INT type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.19 Converting INT to DWORD

## INT\_TO\_DWORD(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert INT type data to DWORD type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=INT_TO_DWORD(s);<br>[With EN/ENO]<br>d:=INT_TO_DWORD_E(EN,ENO,s); |
|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | INT       |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(INT_TO_DWORD(_E)) | Output                                             | Output variable | DWORD     |

### Processing details

#### ■Operation processing

- These functions convert the INT type data input to (s) to DWORD type data and output from (d).
- Each of high-order 16 bits becomes "0" after data conversion.

- A value input to (s) is the INT type data value.

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 20.20 Converting INT to DINT

## INT\_TO\_DINT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert INT type data to DINT type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                        |

20

### Setting data

#### ■Descriptions, types, and data types

| Argument          | Description                                        | Type            | Data type |
|-------------------|----------------------------------------------------|-----------------|-----------|
| EN                | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)             | Input                                              | Input variable  | INT       |
| ENO               | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(INT_TO_BCD(_E)) | Output                                             | Output variable | WORD      |

### Processing details

#### ■Operation processing

- These functions convert the INT type data input to (s) to BCD type data and output from (d).

(1): Make sure to set them to "0".

- A value input to (s) is the INT type data value and within the range from 0 to 9999.

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                |
|----------------------------|----------------------------------------------------------------------------|
| 3401H                      | Data in the device specified by (s) is out of the valid range (0 to 9999). |

# 20.22 Converting INT to REAL

## INT\_TO\_REAL(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert INT type data to REAL type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                        |

| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=INT_TO_STRING(s);<br>[With EN/ENO]<br>d:=INT_TO_STRING_E(EN,ENO,s); |
|  |  |                                                                                            |

20

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | INT       |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(INT_TO_STRING(_E)) | Output                                             | Output variable | STRING(6) |

### Processing details

#### ■Operation processing

- These functions convert the INT type data input to (s) to STRING type data and output from (d).

(1): "00H" is stored when "SM701" (output character number selector) is off.

- A value input to (s) is the INT type data value.
- In "Sign data", 20H (space) is stored when the input value is positive, and 2DH (-) is stored when the input value is negative.
- 20H (space) is stored in high-order digits when the number of significant figures is small.

**Ex.**

When "-123" is input

- 00H is stored at the end (4th word) of the character string when SM701 (output character number selector signal) is off.

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s) and later, "0000H" does not exist.                                                         |
| 3405H                      | The character string specified by (s) has more than 16383 characters.                                                                                       |
| 3406H                      | The whole specified character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 20.25 Converting DINT to BOOL

## DINT\_TO\_BOOL(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert DINT type data to BOOL type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | DINT      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_BOOL(_E)) | Output                                             | Output variable | BOOL      |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to BOOL type data and output from (d).
- When the input value is 0, these functions output "FALSE".
- When the input value is any value other than 0, these functions output "TRUE".

- A value input to (s) is the DINT type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.26 Converting DINT to WORD

## DINT\_TO\_WORD(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert DINT type data to WORD type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=DINT_TO_WORD(s);<br>[With EN/ENO]<br>d:=DINT_TO_WORD_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | DINT      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_WORD(_E)) | Output                                             | Output variable | WORD      |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to WORD type data and output from (d).
- The information stored in high-order 16 bits of an input value is discarded. (Refer to (1) in the figure below.)

- A value input to (s) is the DINT type data value.

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Point

When DINT\_TO\_WORD(\_E) is executed, the information stored in high-order 16 bits of the DINT type data value input from (s) is discarded.

Operation error

There is no operation error.

# 20.27 Converting DINT to DWORD

## DINT\_TO\_DWORD(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert DINT type data to DWORD type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                            |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=DINT_TO_DWORD(s);<br>[With EN/ENO]<br>d:=DINT_TO_DWORD_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | DINT      |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_DWORD(_E)) | Output                                             | Output variable | DWORD     |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to DWORD type data and output from (d).

- A value input to (s) is the DINT type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.28 Converting DINT to INT

## DINT\_TO\_INT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert DINT type data to INT type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument           | Description                                        | Type            | Data type |
|--------------------|----------------------------------------------------|-----------------|-----------|
| EN                 | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)              | Input                                              | Input variable  | DINT      |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_INT(_E)) | Output                                             | Output variable | INT       |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to INT type data and output from (d).

- A value input to (s) is the DINT type data value.

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------|
| 3401H                      | The 32-bit signed binary data in the device specified by (s) is out of the valid range (-32768 to 32767). |

# 20.29 Converting DINT to BCD

## DINT\_TO\_BCD(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert DINT type data to BCD type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                        |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=DINT_TO_BCD(s);<br>[With EN/ENO]<br>d:=DINT_TO_BCD_E(EN,ENO,s); |
|  |  |                                                                                        |

20

### Setting data

#### ■Descriptions, types, and data types

| Argument           | Description                                        | Type            | Data type |
|--------------------|----------------------------------------------------|-----------------|-----------|
| EN                 | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)              | Input                                              | Input variable  | DINT      |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_BCD(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to BCD type data and output from (d).

(1): Make sure to set them to "0".

- A value input to (s) is the DINT type data value. When (d) is WORD, the input value is within the range from 0 to 9999. When (d) is DWORD, the input value is within the range from 0 to 99999999.
- WORD or DWORD can be specified to (d). BOOL cannot be specified.

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- When (d) is WORD

| Error code<br>(SD0/SD8067) | Description                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------|
| 3401H                      | The 32-bit signed binary data in the device specified by (s) is out of the valid range (-32768 to 32767). |
|                            | Data in the device specified by (s) is out of the valid range (0 to 9999).                                |

- When (d) is DWORD

| Error code<br>(SD0/SD8067) | Description                                                                    |
|----------------------------|--------------------------------------------------------------------------------|
| 3401H                      | Data in the device specified by (s) is out of the valid range (0 to 99999999). |

# 20.30 Converting DINT to REAL

## DINT\_TO\_REAL(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert DINT type data to REAL type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | DINT      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_REAL(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to REAL type data and output from (d).

- A value input to (s) is the DINT type data value.
- The number of significant figures of the REAL type data is approximately 7 since the data is processed in 32-bit single precision.
- The converted data includes an error (rounding error) if an integer value is outside the range of -16777216 to 16777215.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.31 Converting DINT to TIME

## DINT\_TO\_TIME(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert DINT type data to TIME type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=DINT_TO_TIME(s);<br>[With EN/ENO]<br>d:=DINT_TO_TIME_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | DINT      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DINT_TO_TIME(_E)) | Output                                             | Output variable | TIME      |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to TIME type data and output from (d).

- A value input to (s) is the DINT type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.32 Converting DINT to STRING

## DINT\_TO\_STRING(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert DINT type data to STRING type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                              |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=DINT_TO_STRING(s);<br>[With EN/ENO]<br>d:=DINT_TO_STRING_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | DINT       |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(DINT_TO_STRING(_E)) | Output                                             | Output variable | STRING(11) |

### Processing details

#### ■Operation processing

- These functions convert the DINT type data input to (s) to STRING type data and output from (d).

(1): "00H" is stored when "SM701" (output character number selector) is off.

- A value input to (s) is the DINT type data value.
- In "Sign data", 20H (space) is stored when the input value is positive, and 2DH (-) is stored when the input value is negative.
- 20H (space) is stored in high-order digits when the number of significant figures is small.

Ex.

When "-123456" is input

- 00H is stored at the end (high-order byte of the 6th word) of the character string when SM701 (output character number selector signal) is off.

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 20.33 Converting BCD to INT

## BCD\_TO\_INT(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert BCD type data to INT type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                      |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=BCD_TO_INT(s);<br>[With EN/ENO]<br>d:=BCD_TO_INT_E(EN,ENO,s); |
|  |  |                                                                                      |

### Setting data

#### ■Descriptions, types, and data types

| Argument          | Description                                        | Type            | Data type |
|-------------------|----------------------------------------------------|-----------------|-----------|
| EN                | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)             | Input                                              | Input variable  | WORD      |
| ENO               | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(BCD_TO_INT(_E)) | Output                                             | Output variable | INT       |

### Processing details

#### ■Operation processing

- These functions convert the BCD type data input to (s) to INT type data and output from (d).

(1): Always becomes "0".

- A value input to (s) is the WORD type data value and within the range from 0H to 9999H (from 0 to 9 for each digit).

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                            |
|----------------------------|--------------------------------------------------------|
| 3401H                      | A value other than 0 to 9 exists in each digit of (s). |

# 20.34 Converting BCD to DINT

## BCD\_TO\_DINT(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert BCD type data to DINT type data.

20

### Setting data

#### ■Descriptions, types, and data types

| Argument           | Description                                        | Type            | Data type |
|--------------------|----------------------------------------------------|-----------------|-----------|
| EN                 | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)              | Input                                              | Input variable  | ANY_BIT   |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(BCD_TO_DINT(_E)) | Output                                             | Output variable | DINT      |

### Processing details

#### ■Operation processing

- These functions convert the BCD type data input to (s) to DINT type data and output from (d).
  - When WORD is specified to (s)

(1): Always becomes "0".

- When DWORD is specified to (s)

(1): Always becomes "0".

- A value input to (s) is within the range from 0H to 9999H (from 0 to 9 for each digit) for the WORD type data value and from 0H to 99999999H (from 0 to 9 for each digit) for the DWORD type data value.
- WORD or DWORD can be specified to (s). BOOL cannot be specified.

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

- When (s) is WORD

| Error code (SD0/SD8067) | Description                                            |
|-------------------------|--------------------------------------------------------|
| 3401H                   | A value other than 0 to 9 exists in each digit of (s). |

- When (s) is DWORD

| Error code (SD0/SD8067) | Description                                            |
|-------------------------|--------------------------------------------------------|
| 3401H                   | A value other than 0 to 9 exists in each digit of (s). |

# 20.35 Converting REAL to INT

## REAL\_TO\_INT(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert REAL type data to INT type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                        |

| s(IN)              | Input                                              | Input variable  | REAL      |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(REAL_TO_INT(_E)) | Output                                             | Output variable | INT       |

### Processing details

#### ■Operation processing

- These functions convert the REAL type data input to (s) to INT type data and output from (d).

- A value input to (s) is the REAL type data value and within the range from -32768 to 32767.
- After conversion, the first digit after the decimal point of the REAL type data value is rounded down.

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Precautions

If the single-precision real number set in (s) is out of the effective value range, the program will not operate correctly.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Setting data

#### ■Descriptions, types, and data types

| Argument            | Description                                        | Type            | Data type |
|---------------------|----------------------------------------------------|-----------------|-----------|
| EN                  | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)               | Input                                              | Input variable  | REAL      |
| ENO                 | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(REAL_TO_DINT(_E)) | Output                                             | Output variable | DINT      |

### Processing details

#### ■Operation processing

- These functions convert the REAL type data input to (s) to DINT type data and output from (d).

- A value input to (s) is the REAL type data value and within the range from -2147483648 to 2147483647.
- After conversion, the first digit after the decimal point of the REAL type data value is rounded down.

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Precautions

If the single-precision real number set in (s) is out of the effective value range, the program will not operate correctly.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                                                         |

# 20.37 Converting REAL to STRING

## REAL\_TO\_STRING(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert REAL type data to STRING type data (exponent format).

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                              |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=REAL_TO_STRING(s);<br>[With EN/ENO]<br>d:=REAL_TO_STRING_E(EN,ENO,s); |
|  |  |                                                                                              |

20

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | REAL       |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(REAL_TO_STRING(_E)) | Output                                             | Output variable | STRING(13) |

### Processing details

#### ■Operation processing

- These functions convert the REAL type data input to (s) to STRING type (exponent format) data and output from (d).

- A value input to (s) is the REAL type data value.
- The string data obtained by conversion is output from (d) as follows:
  - The number of digits is fixed respectively for the integer part, decimal part and exponent part as follows: Integer part: 1, decimal part: 5, exponent part: 2
  - "20H (space)" is stored in the 2nd byte, "2EH (.)" is stored in the 4th byte, and "45H (E)" is stored in the 10th byte automatically.

(1): Total number of digits (13 digits)

(2): Integer part (1 digit)

(3): Decimal part (5 digits)

(4): Exponent part (2 digits)

(5): "20H (SP)" is stored.

(6): "2EH (.)" is stored.

(7): "45H (E)" is stored.

• In "Sign data (integer part)", "20H (space)" is stored when the input value is positive, and "2DH (-)" is stored when the input value is negative.

• The 6th and later digits of the decimal part are rounded.

(1): Total number of digits (13 digits)

(2): Number of digits of decimal part (5)

(3): These digits are rounded off.

• "30H (0)" is stored in the decimal part when the number of significant figures is small.

(1): Total number of digits (13 digits)

(2): Number of digits of decimal part (5)

(3): "30H (0)" is stored.

• In "Sign data (exponent part)", "2BH (+)" is stored when the input value is positive, and "2DH (-)" is stored when the input value is negative.

• "30H (0)" is stored in the tens place of the exponent part when the exponent part consists of 1 digit.

(1): Total number of digits (13 digits)

(2): Number of digits of exponent part (2)

(3): "30H (0)" is stored.

• "00H" is automatically stored at the end (7th word) of the character string.

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=TIME_TO_DWORD(s);<br>[With EN/ENO]<br>d:=TIME_TO_DWORD_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | TIME      |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(TIME_TO_DWORD(_E)) | Output                                             | Output variable | DWORD     |

### Processing details

#### ■Operation processing

- These functions convert the TIME type data input to (s) to DWORD type data and output from (d).

- A value input to (s) is the TIME type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.41 Converting TIME to INT

## TIME\_TO\_INT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert TIME type data to INT type data.

### Setting data

#### ■Descriptions, types, and data types

| Argument           | Description                                        | Type            | Data type |
|--------------------|----------------------------------------------------|-----------------|-----------|
| EN                 | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)              | Input                                              | Input variable  | TIME      |
| ENO                | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(TIME_TO_INT(_E)) | Output                                             | Output variable | INT       |

### Processing details

#### ■Operation processing

- These functions convert the TIME type data input to (s) to INT type data and output from (d).

- A value input to (s) is the TIME type data value.
- When the data is converted to INT, the TIME type data stored in high-order 16 bits (1 word) are ignored.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.42 Converting TIME to DINT

## TIME\_TO\_DINT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert TIME type data to DINT type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | TIME       |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(TIME_TO_STRING(_E)) | Output                                             | Output variable | STRING(11) |

### Processing details

#### ■Operation processing

- These functions convert the TIME type data input to (s) to STRING type data and output from (d).

- A value input to (s) is the TIME type data value.
- 00H is stored at the end of the character string when SM701 (output character number selector signal) is off.
- The following shows the operation result to be stored in the output.
  - As the 1st character, "20H" (space) is stored if the binary data is positive, and "2DH" (-) is stored if the data is negative.
  - "20H" (space) is stored on the left side of the effective digits.

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 20.44 Converting STRING to BOOL

## STRING\_TO\_BOOL(\_E)

FX5S FX5UJ FX5U FX5UC

These functions convert STRING type data to BOOL type data.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                              |

|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=STRING_TO_INT(s);<br>[With EN/ENO]<br>d:=STRING_TO_INT_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)                | Input                                              | Input variable  | STRING(6) |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(STRING_TO_INT(_E)) | Output                                             | Output variable | INT       |

### Processing details

#### ■Operation processing

- These functions convert the STRING type data input to (s) to INT type data and output from (d).

- A value input to (s) is the STRING type data value and within the following range.
  - Within the range of "30H" to "39H", "20H", "2DH", and "00H" in ASCII code
  - Within the range of "-32768" to "32767" as the STRING type data value

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                |

|  |  |                                                                                              |

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | STRING(11) |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(STRING_TO_DINT(_E)) | Output                                             | Output variable | DINT       |

### Processing details

#### ■Operation processing

- These functions convert the STRING type data input to (s) to DINT type data and output from (d).

|    | High-order byte                                  | (s) | Low-order byte                        |                                                                                       |
|----|--------------------------------------------------|-----|---------------------------------------|---------------------------------------------------------------------------------------|
| +0 | ASCII code for billions place                    |     | Sign data                             |  |
| +1 | ASCII code for ten-millions place                |     | ASCII code for hundred-millions place |                                                                                       |
| +2 | ASCII code for hundred-thousands place           |     | ASCII code for millions place         |                                                                                       |
| +3 | ASCII code for thousands place                   |     | ASCII code for ten-thousands place    |                                                                                       |
| +4 | ASCII code for tens place                        |     | ASCII code for hundreds place         |                                                                                       |
| +5 | 00H (Indicates the end of the character string.) |     | ASCII code for ones place             |                                                                                       |

- A value input to (s) is the STRING type data value and within the following range.
  - Within the range of "30H" to "39H", "20H", "2DH", and "00H" in ASCII code
  - Within the range of "-2147483648" to "2147483647" as the STRING type data value

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3401H                      | Invalid data which cannot be converted to (s) are input. <ul style="list-style-type: none"><li>• Values for each place of the ASCII code are other than "30H" to "39H", "20H", and "00H".</li><li>• Values for the ASCII data are other than "-2147483648" to "2147483647" when STRING_TO_DINT(_E) is used.</li></ul> |

# 20.47 Converting STRING to REAL

## STRING\_TO\_REAL(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions convert STRING type data to REAL type data.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                              |

|  |  |                                                                                              |

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | STRING(24) |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(STRING_TO_REAL(_E)) | Output                                             | Output variable | REAL       |

### Processing details

#### ■Operation processing

- These functions convert the STRING type (in the decimal format or exponent format) data input to (s) to REAL type data and output from (d).

| (s)             |                                                  |                                                                                       |
|-----------------|--------------------------------------------------|---------------------------------------------------------------------------------------|
| High-order byte | Low-order byte                                   |                                                                                       |
| +0              | Sign data                                        |  |
| +1              | ASCII code for 2nd character                     |                                                                                       |
| +2              | ASCII code for 4th character                     |                                                                                       |
| +3              | ASCII code for 6th character                     |                                                                                       |
| +4              | ASCII code for 8th character                     |                                                                                       |
| +5              | ASCII code for 10th character                    |                                                                                       |
| +6              | 00H (Indicates the end of the character string.) |                                                                                       |

- The conversion source STRING type data can be in the decimal format or exponent format.
  - Decimal point format

| (s)             |                |                                                                                       |
|-----------------|----------------|---------------------------------------------------------------------------------------|
| High-order byte | Low-order byte |                                                                                       |
| +0              | 2DH (-)        |  |
| +1              | 2EH (.)        |                                                                                       |
| +2              | 35H (5)        |                                                                                       |
| +3              | 33H (3)        |                                                                                       |
| +4              | 00H            |                                                                                       |
| 135034          |                |                                                                                       |

• Exponent format

(s)

|    | High-order byte | Low-order byte |
|----|-----------------|----------------|
| +0 | 31H (1)         | 2DH (-)        |
| +1 | 33H (3)         | 2EH (.)        |
| +2 | 30H (0)         | 35H (5)        |
| +3 | 34H (4)         | 33H (3)        |
| +4 | 2DH (-)         | 45H (E)        |
| +5 | 30H (0)         | 31H (1)        |
| +6 | 00H             |                |

(d)

-1.35034E-10

REAL

["1","3","5","0","3","4","E","-","1","0"]

- With regard to STRING type data, six digits excluding the sign, decimal point and exponent part are valid, and the 7th and later digits are discarded during conversion.
- Decimal point format

• Exponent format

- When 2BH (+) is specified as the sign in the floating point format or when the sign is omitted, a character string is converted into a positive value. It is handled as negative value during conversion when the sign is set to 2DH (-).
- String data in the exponent format is handled as positive value during conversion when the sign of the exponent part is set to 2BH (+) or when the sign is omitted. When 2DH (-) is specified as the sign, a character string is converted into a negative value.
- When 20H (space) or 30H (0) exists between numbers except the first 0 in STRING type data, 20H or 30H is ignored during conversion.
- Decimal point format

• Exponent format

- When 30H (0) exists between a number and "E" in STRING type data (exponent format), 30H is ignored during conversion.

- When 20H (space) is contained in character string, 20H is ignored during conversion.
- Up to 24 characters can be input as STRING type data. 20H (space) and 30H (0) in a character string are counted as one character respectively.
- A value input to (s) is the STRING type data value and within the following range.
  - Within the range of "30H" to "39H", "45H", "2BH", "2DH", "2EH", "20H" and "00H" in ASCII code

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Setting data

#### ■Descriptions, types, and data types

| Argument              | Description                                        | Type            | Data type  |
|-----------------------|----------------------------------------------------|-----------------|------------|
| EN                    | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL       |
| s(IN)                 | Input                                              | Input variable  | STRING(11) |
| ENO                   | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL       |
| d(STRING_TO_TIME(_E)) | Output                                             | Output variable | TIME       |

### Processing details

#### ■Operation processing

- These functions convert the STRING type data input to (s) to TIME type data and output from (d).

- A value input to (s) is the STRING type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                                | Type            | Data type          |
|----------------------|------------------------------------------------------------|-----------------|--------------------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop)         | Input variable  | BOOL               |
| s(BitArr)            | Input (Variables are available for element specification.) | Input variable  | BOOL array element |
| n                    | Only a constant 4, 8, 12 or 16 can be specified.           | Input variable  | INT                |
| ENO                  | Output status (TRUE: Normal , FALSE: Abnormal)             | Output variable | BOOL               |
| d(BITARR_TO_INT(_E)) | Output                                                     | Output variable | ANY16              |

### Processing details

#### ■Operation processing

- These functions convert the data for bits specified by (n) starting from the bit array element input to (s) to ANY 16 type data and output from (d).
- "0" is set to output bits beyond the specified number of bits.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.50 Converting Bit Array to DINT

## BITARR\_TO\_DINT(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These functions convert a bit array to DINT type data for a specified number of bits.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                                 |

### Processing details

#### ■Operation processing

- These functions convert the data for bits specified by (n) starting from the bit array element input to (s) to ANY 32 type data and output from (d).
- "0" is set to output bits beyond the specified number of bits.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.51 Converting INT to Bit Array

## INT\_TO\_BITARR(\_E)

FX5S

FX5UJ

FX5U

FX5UC

These functions output low-order (n) bits of INT type data to a bit array.

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                                 | Type            | Data type          |
|----------------------|-------------------------------------------------------------|-----------------|--------------------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop)          | Input variable  | BOOL               |
| s                    | Input                                                       | Input variable  | ANY16              |
| n                    | Only a constant 4, 8, 12 or 16 can be specified.            | Input variable  | INT                |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)               | Output variable | BOOL               |
| d(INT_TO_BITARR(_E)) | Output (Variables are available for element specification.) | Output variable | BOOL array element |

### Processing details

#### ■Operation processing

- These functions output low-order (n) bits of ANY 16 type data specified to (s).
- Output bits beyond the specified number of bits are not changed.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 20.52 Converting DINT to Bit Array

## DINT\_TO\_BITARR(\_E)

FX5S FX5UJ FX5U FX5UC

These functions output low-order (n) bits of DINT type data to a bit array.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                                  |

|-------------------------------------------------|-------------|-----------------|---------------|
| s                                               | Input       | Input variable  | ANY           |
| d(GET_BOOL_ADDR / GET_INT_ADDR / GET_WORD_ADDR) | Output      | Output variable | BOOL/INT/WORD |

### Processing details

#### ■Operation processing

- These functions output the input data variable as the output variable type according to the following table.

| General function | Input data type                                                                                                                              | Output data type |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| GET_BOOL_ADDR    | BOOL<br>ARRAY OF BOOL                                                                                                                        | BOOL             |
| GET_INT_ADDR     | INT                                                                                                                                          | INT              |
| GET_WORD_ADDR    | DINT<br>WORD<br>REAL<br>TIME<br>STRING<br>ARRAY OF INT<br>ARRAY OF DINT<br>ARRAY OF WORD<br>ARRAY OF DWORD<br>ARRAY OF REAL<br>ARRAY OF TIME | WORD             |

#### ■Operation result

The operation processing is executed. The operation output value is output from (d).

### Operation error

There is no operation error.

# 21 SINGLE NUMBER VARIABLE FUNCTIONS

## 21.1 Absolute Value

### ABS(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the absolute value of an input value.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_NUM   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ABS(_E)) | Output                                             | Output variable | ANY_NUM   |

### Processing details

#### ■Operation processing

- These functions output the absolute value of the INT, DINT, or REAL type data input to (s) in the same data type as (s) from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
$$B=|A|$$
- A value input to (s) is the INT, DINT, or REAL type data value.
- When -32768 is input while the data type of (s) is INT, -32768 is output from (d).
- When -2147483648 is input while the data type of (s) is DINT, -2147483648 is output from (d). (An operation error does not occur. "ABS\_E" outputs "TRUE" from output variable ENO.)

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- When (s) is REAL

| Error code<br>(SD0/SD8067) | Description                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------|
| 3402H                      | The data specified by (s) is -0, denormalized number, NaN (not a number), or $\pm\infty$ . |
| 3403H                      | (d) exceeds the following range. (An overflow has occurred.)<br>$ (d)  < 2^{128}$          |

## 21.2 Square Root

### SQRT(\_E)

FX5S

FX5UJ

FX5U

FX5UC

These functions output the square root of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                                    |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br><code>d:=SQRT(s);</code><br>[With EN/ENO]<br><code>d:=SQRT_E(EN,ENO,s);</code> |
|  |  |                                                                                                    |

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)       | Input                                              | Input variable  | REAL      |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SQRT(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions output the square root of the REAL type data input to (s) from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".

$$B = \sqrt{A}$$

- A value input to (s) is the REAL type data value and within the positive value range.

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

| Error code (SD0/SD8067) | Description                |
|-------------------------|----------------------------|
| 3405H                   | A negative value is input. |

## 21.3 Natural Logarithm Operation

### LN(\_E)

**FX5S****FX5UJ****FX5U****FX5UC**

These functions output the natural logarithm operation result of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                      |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=LN(s);<br>[With EN/ENO]<br>d:=LN_E(EN,ENO,s); |
|  |  |                                                                      |

### Setting data

#### ■Descriptions, types, and data types

| Argument  | Description                                        | Type            | Data type |
|-----------|----------------------------------------------------|-----------------|-----------|
| EN        | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)     | Input                                              | Input variable  | REAL      |
| ENO       | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(LN(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the logarithm whose base is "e" of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \log_e A$
- In the natural logarithm operation, the base "e" is set to "2.71828".

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

| Error code (SD0/SD8067) | Description                |
|-------------------------|----------------------------|
| 3405H                   | A negative value is input. |

# 21.4 Calculating the Common Logarithm

## LOG(\_E)

FX5S FX5UJ FX5U FX5UC

These functions output the operation result of the common logarithm (the logarithm whose base is 10) of an input value.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                        |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=LOG(s);<br>[With EN/ENO]<br>d:=LOG_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | REAL      |
| ENO        | Output condition (TRUE: Normal, FALSE: Abnormal)   | Output variable | BOOL      |
| d(LOG(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the logarithm whose base is "10" of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
$$B=\log_{10}A$$
- A value input to (s) is the REAL type data value.
- Only a positive value can be set in (s). (The logarithm operation cannot be executed for a negative value).
- When the operation result is -0 or underflow occurs, the operation result is regarded as 0.

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- When (s) is REAL

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3402H                      | The value specified in (s) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .                                                                   |
| 3403H                      | The value of (d) exceeds the following range. (An overflow has occurred.)<br>$ (d)  < 2^{128}$                                                                |
| 3405H                      | Data outside the allowable range was set to (s). <ul style="list-style-type: none"><li>• A negative value is specified.</li><li>• "0" is specified.</li></ul> |

# 21.5 Exponential Operation

## EXP(\_E)

FX5S

FX5UJ

FX5U

FX5UC

These functions output the exponential operation result of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                                               |

## Setting data

### ■ Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | REAL      |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(EXP(_E)) | Output                                             | Output variable | REAL      |

## Processing details

### ■ Operation processing

- These functions calculate the exponent of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = e^A$
- In the exponential operation, the base "e" is set to "2.71828".
- A value input to (s) is the REAL type data value.

### ■ Operation result

#### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

#### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code (SD0/SD8067) | Description                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------|
| 3403H                   | The data after conversion is not $-3.40282^{+38}$ to $-1.17549^{-38}$ , or $1.17549^{-38}$ to $3.40282^{+38}$ . |

# 21.6 Sine Operation

## SIN(\_E)

**FX5S****FX5UJ****FX5U****FX5UC**

These functions output the sine of the angle of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                        |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=SIN(s);<br>[With EN/ENO]<br>d:=SIN_E(EN,ENO,s); |
|  |  |                                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | REAL      |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SIN(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the sine of the angle of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \sin A$
- A value (angle) input to (s) is the REAL type data value. Input a value in radians ( $\text{angle} \times \pi / 180$ ).

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

| Error code (SD0/SD8067) | Description                |
|-------------------------|----------------------------|
| 3402H                   | A negative value is input. |

# 21.7 Cosine Operation

## COS(\_E)

FX5S

FX5UJ

FX5U

FX5UC

These functions output the cosine of the angle of an input value.

| Ladder diagram, FBD/LD |               | Structured text                                                        |
|------------------------|---------------|------------------------------------------------------------------------|
| [Without EN/ENO]       | [With EN/ENO] | [Without EN/ENO]<br>d:=COS(s);<br>[With EN/ENO]<br>d:=COS_E(EN,ENO,s); |

21

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | REAL      |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(COS(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the cosine of the angle of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \cos A$
- A value (angle) input to (s) is the REAL type data value. Input a value in radians ( $\text{angle} \times \pi / 180$ ).

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

| Error code (SD0/SD8067) | Description                |
|-------------------------|----------------------------|
| 3402H                   | A negative value is input. |

# 21.8 Tangent Operation

## TAN(\_E)

FX5S FX5UJ FX5U FX5UC

These functions output the tangent of the angle of an input value.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                        |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=TAN(s);<br>[With EN/ENO]<br>d:=TAN_E(EN,ENO,s); |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | REAL      |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(TAN(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the tangent of the angle data of the REAL type data (angle) input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
B=TAN A
- Even when the input value is  $\pi/2$  radian or  $(3/2)\pi$  radian, no error occurs because an operation error occurs in a radian value.
- A value (angle) input to (s) is the REAL type data value. Input a value in radians (angle $\times\pi/180$ ).

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)       | Input                                              | Input variable  | REAL      |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ASIN(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the arc sine of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \sin^{-1} A$
- A value input to (s) is the REAL type data value and within the following range.  
ASIN(\_E): -1.0 to 1.0
- A value (angle) in radians ( $\text{angle} \times \pi / 180$ ) is output from (d).

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

| Error code<br>(SD0/SD8067) | Description                                                 |
|----------------------------|-------------------------------------------------------------|
| 3402H                      | A negative value is input.                                  |
| 3405H                      | A value input by these functions is other than -1.0 to 1.0. |

# 21.10 Arc Cosine Operation

## ACOS(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the arc cosine value of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                        |

|  |  |                                                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)       | Input                                              | Input variable  | REAL      |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ACOS(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the arc cosine of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \cos^{-1} A$
- A value input to (s) is the REAL type data value and within the following range.  
 $\text{ACOS\_E: } -1.0 \text{ to } 1.0$
- A value (angle) in radians ( $\text{angle} \times \pi / 180$ ) is output from (d).

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)       | Input                                              | Input variable  | REAL      |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ATAN(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions calculate the arc tangent value of the REAL type data input to (s), and output from (d).
- These functions are expressed as follows when the input value is "A" and the output operation result is "B".  
 $B = \tan^{-1} A$
- A value input to (s) is the REAL type data value and within the following range.  
 $\text{ATAN\_E: } \pm 1.17549 \times 10^{-38} \text{ to } \pm 3.40282 \times 10^{38}$
- A value (angle) in radians ( $\text{angle} \times \pi / 180$ ) is output from (d).

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                  | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

| Error code<br>(SD0/SD8067) | Description  |
|----------------------------|--------------|
| 3402H                      | -0 is input. |

# 22 ARITHMETIC OPERATION FUNCTIONS

## 22.1 Addition

### ADD(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the sum of input values ((s1) + (s2) + ... + (s28)).

### Processing details

#### ■Operation processing

- These functions add the INT, DINT, or REAL type data ((s1) + (s2) + ... + (s28)) input to (s1) to (s28), and output from (d) in the same data type as (s).

**Ex.**

Data type is the INT type

- A value input to (s1) to (s28) is the INT, DINT, or REAL type data value.
- If an underflow and an overflow occur in the operation result, the result will be output as follows from (d).

| Data type is INT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Data type is DINT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Data type is REAL                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. "ADD_E" outputs "TRUE" from ENO.</li> </ul> <p>[Example 1]<br/> <math>32767+2=-32767</math><br/> <math>(7FFFH)+(0002H)=8001H</math><br/>                     The most significant bit becomes 1, and a negative value is output.</p> <p>[Example 2]<br/> <math>-32768+(-2)=32766</math><br/> <math>(8000H)+(FFFEH)=(7FFFH)</math><br/>                     The most significant bit becomes 0, and a positive value is output.</p> | <ul style="list-style-type: none"> <li>• Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. "ADD_E" outputs "TRUE" from ENO.</li> </ul> <p>[Example 1]<br/> <math>2147483647+2=-2147483647</math><br/> <math>(7FFFFFFFH)+(00000002H)=(80000001H)</math><br/>                     The most significant bit becomes 1, and a negative value is output.</p> <p>[Example 2]<br/> <math>-2147483648+(-2)=2147483646</math><br/> <math>(80000000H)+(FFFFFFFEH)=(7FFFFFFEH)</math><br/>                     The most significant bit becomes 1, and a positive value is output.</p> | An operation error occurs and an undefined value is output. |

- When the operation result is 0, the zero flag (SM8020) turns on.

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) to (s28) are REAL

| Error code (SD0/SD8067) | Description                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------|
| 3402H                   | The data specified by (s1) to (s28) is -0, denormalized number, NaN (not a number), or $\pm\infty$ . |
| 3403H                   | (d) exceeds the following range. (An overflow has occurred.)<br>$ (d)  < 2^{128}$                    |

# 22.2 Multiplication

## MUL(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the product input values ((s1)×(s2)× ... ×(s28)).

| Ladder diagram, FBD/LD*1                                                          |                                                                                   | Structured text*1                                                              |

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

When the operation result exceeds the data type range, convert the data type of an input value then perform the operation.

22

## Operation error

- (s1) to (s28) are REAL

| Error code<br>(SD0/SD8067) | Description                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                        | Type            | Data type |
|------------------|----------------------------------------------------|-----------------|-----------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1), s2(IN2) | Input                                              | Input variable  | ANY_NUM   |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SUB(_E))       | Output                                             | Output variable | ANY_NUM   |

### Processing details

#### ■Operation processing

- These functions subtract the INT, DINT, or REAL type data input to (s1) and (s2) ((s1)-(s2)), and output the operation result from (d) in the same data type as (s).

**Ex.**

Data type is INT

- A value input to (s1) and (s2) is the INT, DINT, or REAL type data value.
- If an underflow and an overflow occur in the operation result, the result will be output as follows from (d).

| Data type is INT                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Data type is DINT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Data type is REAL                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>• Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. - When the operation result is 0, the zero flag (SM8020) turns on.

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

- (s1) and (s2) are REAL

| Error code (SD0/SD8067) | Description                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------|
| 3402H                   | The data specified by (s1) is -0, denormalized number, NaN (not a number), or $\pm\infty$ . |
|                         | The data specified by (s2) is -0, denormalized number, NaN (not a number), or $\pm\infty$ . |
| 3403H                   | (d) exceeds the following range. (An overflow has occurred.)<br>$ (\text{d})  < 2^{128}$    |

# 22.4 Division

## DIV(\_E)

FX5S

FX5UJ

FX5U

FX5UC

These functions output the quotient of input values ((s1) ÷ (s2)).

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                |

|  |  |                                                                                |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1)    | Dividend                                           | Input variable  | ANY_NUM   |
| s2(IN2)    | Divisor                                            | Input variable  | ANY_NUM   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DIV(_E)) | Output                                             | Output variable | ANY_NUM   |

### Processing details

#### ■Operation processing

- These functions divide the INT, DINT, or REAL type data input to (s1) and (s2) ((s1) ÷ (s2)), and output the operation result from (d) in the same data type as (s).

Ex.

Data type is INT

- A value input to (s1) and (s2) is the INT, DINT, or REAL type data value. (However, input other than 0 to (s2).)

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) and (s2) are INT

| Error code<br>(SD0/SD8067) | Description                                 |

|  |  |                                                                                                                                                                              |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1)    | Dividend                                           | Input variable  | ANY_INT   |
| s2(IN2)    | Divisor                                            | Input variable  | ANY_INT   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(MOD(_E)) | Output                                             | Output variable | ANY_INT   |

### Processing details

#### ■Operation processing

- These functions divide the INT or DINT type data input to (s1) and (s2) ((s1) ÷ (s2)), and output the remainder from (d) in the same data type as (s).

**Ex.**

Data type is INT

- A value input to (s1) and (s2) is the INT and DINT type data value. (However, input other than 0 to (s2).)

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

- (s1) and (s2) are INT

| Error code (SD0/SD8067) | Description                                 |

| 3400H                   | The value (divisor) specified by (s2) is 0. |

- (s1) and (s2) are DINT

| Error code (SD0/SD8067) | Description                                 |
|-------------------------|---------------------------------------------|
| 3400H                   | The value (divisor) specified by (s2) is 0. |

# 22.6 Exponentiation

## EXPT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the exponentiation of an input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                  |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=EXPT(s1,s2);<br>[With EN/ENO]<br>d:=EXPT_E(EN,ENO,s1,s2); |
|  |  |                                                                                  |

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1)     | Cardinal number                                    | Input variable  | REAL      |
| s2(IN2)     | Exponent                                           | Input variable  | ANY_NUM   |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(EXPT(_E)) | Output                                             | Output variable | REAL      |

### Processing details

#### ■Operation processing

- These functions raise the REAL type data input to (s1) by INT, DINT, or REAL specified by (s2), and output the operation result from (d).

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) is the REAL type and (s2) is the INT type

| Error code<br>(SD0/SD8067) | Description                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------|
| 3402H                      | The value of (s1) is outside the following range.<br>$0, 2^{-126} \leq  (s1)  < 2^{128}$        |
|                            | The data specified by (s1) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .     |
| 3403H                      | The operation result is within the following range.<br>$2^{128} \leq  \text{operation result} $ |

- (s1) is the REAL type and (s2) is the DINT type

| Error code<br>(SD0/SD8067) | Description                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------|
| 3402H                      | The value of (s1) is outside the following range.<br>$0, 2^{-126} \leq  (s1)  < 2^{128}$        |
|                            | The data specified by (s1) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .     |
| 3403H                      | The operation result is within the following range.<br>$2^{128} \leq  \text{operation result} $ |

- (s1) and (s2) are REAL

| Error code<br>(SD0/SD8067) | Description                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------|
| 3402H                      | The value of (s1) is outside the following range.<br>$0, 2^{-126} \leq  (s1)  < 2^{128}$        |
|                            | The data specified by (s1) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .     |
|                            | The value of (s2) is outside the following range.<br>$0, 2^{-126} \leq  (s2)  < 2^{128}$        |
|                            | The data specified by (s2) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .     |
| 3403H                      | The operation result is within the following range.<br>$2^{128} \leq  \text{operation result} $ |

# 22.7 Move Operation

## MOVE(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the assignment of input values.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=MOVE(s);<br>[With EN/ENO]<br>d:=MOVE_E(EN,ENO,s); |
|  |  |                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument    | Description                                        | Type            | Data type |
|-------------|----------------------------------------------------|-----------------|-----------|
| EN          | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)       | Input                                              | Input variable  | ANY       |
| ENO         | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(MOVE(_E)) | Output                                             | Output variable | ANY       |

### Processing details

#### ■Operation processing

- These functions assign the value of variable specified to (s) to the variable specified to (d).
- BOOL, INT, DINT, WORD, DWORD, REAL, STRING, TIME, structure, or array type can be specified for (s) and (d). Specify the same data type for (s) and (d).

■Operation result

1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s) and later, "00H" does not exist.                                                           |
| 3405H                      | The character string specified by (s) has more than 16383 characters.                                                                                       |
| 3406H                      | The whole specified character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 23 BIT SHIFT FUNCTIONS

## 23.1 n-bit Left Shift

### SHL(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions shift an input value leftward by (n) bits and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                            |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=SHL(s,n);<br>[With EN/ENO]<br>d:=SHL_E(EN,ENO,s,n); |
|  |  |                                                                            |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_BIT   |
| n(N)       | Number of shift bits                               | Input variable  | ANY_BIT   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SHL(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

- These functions shift the 16-bit or 32-bit data (WORD or DWORD type) input to (s) left by (n) bits and output the result in the same data type as (s) from (d).
- The number input in (n) is used as the number of left-shift bits.

**Ex.**

When the data type of (s) is 16-bit data (WORD) and 8 is input in (n)

- "0" is set to "n" bits from the least significant bit.
- The input data to (s) is 16-bit data/32-bit data (WORD or DWORD type).
- A value input to (n) (Number of shift bits) is the INT type data value and within the following range.

| When the data of (s) is 16-bit data (WORD)                                                                                                                           | When the data of (s) is 32-bit data (DWORD)                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A value in (n) is within 0 to 15.<br>The lower 4-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6: 6<br>When the input value is 22: 6 | A value in (n) is within 0 to 31.<br>The lower 5-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6: 6<br>When the input value is 22: 22 |

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

There is no operation error.

# 23.2 n-bit Right Shift

## SHR(\_E)

FX5S FX5UJ FX5U FX5UC

These functions shift an input value rightward by (n) bits and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                            |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=SHR(s,n);<br>[With EN/ENO]<br>d:=SHR_E(EN,ENO,s,n); |
|  |  |                                                                            |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_BIT   |
| n(N)       | Number of shift bits                               | Input variable  | ANY_BIT   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SHR(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

- These functions shift the 16-bit or 32-bit data (WORD or DWORD type) input to (s) right by (n) bits and output the result in the same data type as (s) from (d).
- The number input in (n) is used as the number of right-shift bits.

Ex.

When the data type of (s) is 16-bit data (WORD) and 8 is input in (n)

- "0" is set to "n" bits from the most significant bit.
- The input data to (s) is 16-bit data/32-bit data (WORD or DWORD type).
- A value input to (n) (Number of shift bits) is the INT type data value and within the following range.

| When the data of (s) is 16-bit data (WORD)                                                                                                                         | When the data of (s) is 32-bit data (DWORD)                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A value in (n) is within 0 to 15.<br>The lower 4-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6:<br>When the input value is 22: 6 | A value in (n) is within 0 to 31.<br>The lower 5-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6: 6<br>When the input value is 22: 22 |

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

There is no operation error.

# 23.3 n-bit Left Rotation

## ROL(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions rotate an input value leftward by (n) bits and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|

|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_BIT   |
| n(N)       | Number of shift bits                               | Input variable  | ANY_BIT   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ROL(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

- These functions rotate the 16-bit or 32-bit data (WORD or DWORD type) input to (s) left by (n) bits and output the result in the same data type as (s) from (d).
- The number input in (n) is used as the number of left-rotation bits.

**Ex.**

When the data type of (s) is 16-bit data (WORD) and 3 is input in (n) (The bits are rotated left by 3 bits.)

- The input data to (s) is 16-bit data/32-bit data (WORD or DWORD type).
- A value input to (n) (Number of shift bits) is the INT type data value and within the following range.

| When the data of (s) is 16-bit data (WORD)                                                                                                                        | When the data of (s) is 32-bit data (DWORD)                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A value in (n) is within 0 to 15.<br>The lower 4-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6<br>When the input value is 22: 6 | A value in (n) is within 0 to 31.<br>The lower 5-bit data of the value in (n) is used.<br>[Example]<br>When the input value is 6: 6<br>When the input value is 22: 22 |

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 23.4 n-bit Right Rotation

## ROR(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions rotate an input value rightward by (n) bits and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                            |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=ROR(s,n);<br>[With EN/ENO]<br>d:=ROR_E(EN,ENO,s,n); |
|  |  |                                                                            |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_BIT   |

\*1 The input variable "s" can be changed in the range of 2 to 28.

### Setting data

#### ■Descriptions, types, and data types

| Argument                      | Description                                        | Type            | Data type |
|-------------------------------|----------------------------------------------------|-----------------|-----------|
| EN                            | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1) to s28(IN28)          | Input                                              | Input variable  | ANY_BIT   |
| ENO                           | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(AND(_E) / OR(_E) / XOR(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

##### 1. AND(\_E)

- These functions perform the logical AND on the BOOL, WORD, or DWORD type data input in (s1) to (s28) bit by bit, and output the operation result from (d) in the same data type as (s).

**Ex.**

When the data type is WORD

## 2. OR(\_E)

- These functions perform the logical OR on the BOOL, WORD, or DWORD type data input in (s1) to (s28) bit by bit, and output the operation result from (d) in the same data type as (s).

**Ex.**

When the data type is WORD

## 3. XOR(\_E)

- These functions perform the exclusive logical OR on the BOOL, WORD, or DWORD type data input in (s1) to (s28) bit by bit, and output the operation result from (d) in the same data type as (s).

**Ex.**

When the data type is WORD

- When three or more variables (s) exist, XOR is performed between (s1) and (s2) first, and XOR is successively performed between the result and (s3). When the expression includes (s4), XOR is performed between the result of XOR with (s3) and (s4). In this manner, XOR is repeated by the number of variables (s) in the order with (s5), (s6), and so on.

**Ex.**

When the data type is BOOL

(1): For 3 INs

(2): For 4 INs

(3): For 5 INs

(4): XOR is repeated by the number of variables (s).

## ■ Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 24.2 Logical Negation

## NOT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the logical negation of input values.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                        |

| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=NOT(s);<br>[With EN/ENO]<br>d:=NOT_E(EN,ENO,s); |
|  |  |                                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type |
|------------|----------------------------------------------------|-----------------|-----------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)      | Input                                              | Input variable  | ANY_BIT   |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(NOT(_E)) | Output                                             | Output variable | ANY_BIT   |

### Processing details

#### ■Operation processing

- These functions calculate the logical negation for each bit of the BOOL, WORD, or DWORD type data input in (s), and output the operation result from (d) in the same data type as (s).

**Ex.**

When the data type is WORD

|     |     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|-----|-----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| (s) | 0   | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
|     | NOT |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| (d) | 1   | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

- A value input to (s) is the BOOL, WORD, or DWORD type data value.

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Operation error

There is no operation error.

# 25 SELECTION FUNCTIONS

## 25.1 Selection

### SEL(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output a selected input value.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                      |

### Processing details

#### ■ Operation processing

- These functions output a value input to (s2) and (s3) according to a value input to (s1) in the same data type as (s2) and (s3) from (d).
- When FALSE(=0) is input to (s1), these functions output an input value of (s2) from (d).
- When TRUE(=1) is input to (s1), these functions output an input value of (s3) from (d).

**Ex.**

The data type of (s2) and (s3) is the INT type ((s2) and (s3) of an argument correspond to the bit value of (s1) (0 or 1).)

- A value input to (s1) is the BOOL type data value.
- A data value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, TIME, structure, or array type can be input to (s2) and (s3).

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s2) and (s3) are the STRING type

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | "00H" is not set to a label specified by (s2) or devices from the device number to end device number of corresponding device.                                   |
|                            | "00H" is not set to a label specified by (s3) or devices from the device number to the end device number of corresponding device.                               |
| 3406H                      | The specified character string cannot be stored in a label specified by (d) or devices from the device number to the end device number of corresponding device. |

# 25.2 Selecting Maximum/Minimum Value

## MAX(\_E), MIN(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

- MAX(\_E): These functions output the maximum value of an input value.
- MIN(\_E): These functions output the minimum value of an input value.

| Ladder diagram, FBD/LD*1 |  | Structured text*1                                                   |
|--------------------------|--|---------------------------------------------------------------------|
| [Without EN/ENO]         |  | [Without EN/ENO]<br>d:=MAX(s1,s2);<br>d:=MIN(s1,s2);                |
| [With EN/ENO]            |  | [With EN/ENO]<br>d:=MAX_E(EN,ENO,s1,s2);<br>d:=MIN_E(EN,ENO,s1,s2); |

\*1 The input variable "s" can be changed in the range of 2 to 28.

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type      |
|----------------------|----------------------------------------------------|-----------------|----------------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL           |
| s1(IN1) to s28(IN28) | Input                                              | Input variable  | ANY_ELEMENTARY |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL           |
| d(MAX(_E) / MIN(_E)) | Output                                             | Output variable | ANY_ELEMENTARY |

### Processing details

#### ■Operation processing

- MAX(\_E)  
These functions output the maximum value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, or TIME type data input to (s1) to (s28) in the same data type as (s) from (d).

**Ex.**

Data type is INT

- MIN(\_E)  
These functions output the minimum value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, or TIME type data input to (s1) to (s28) in the same data type as (s) from (d).

**Ex.**

Data type is INT

- A data value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, or TIME type can be input to (s1) to (s28).
- The number of pins for (s) can be changed in the range of 2 to 28.

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) to (s28) are STRING

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s1) to (s28) and later, "00H" does not exist.                                                 |
| 3405H                      | The character string specified by (s1) to (s28) has more than 16383 characters.                                                                             |
| 3406H                      | The whole specified character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 25.3 Limit Control

25

## LIMIT(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output an input value controlled with the upper and lower limits.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                                                    |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br><code>d:=LIMIT(s1,s2,s3);</code><br>[With EN/ENO]<br><code>d:=LIMIT_E(EN,ENO,s1,s2,s3);</code> |
|  |  |                                                                                                                    |

### Setting data

#### ■Descriptions, types, and data types

| Argument     | Description                                                  | Type            | Data type      |
|--------------|--------------------------------------------------------------|-----------------|----------------|
| EN           | Execution condition (TRUE: Execution, FALSE: Stop)           | Input variable  | BOOL           |
| s1(MIN)      | Lower limit value (minimum output threshold value)           | Input variable  | ANY_ELEMENTARY |
| s2(IN)       | Input value to be controlled with the upper and lower limits | Input variable  | ANY_ELEMENTARY |
| s3(MX)       | Upper limit value (maximum output threshold value)           | Input variable  | ANY_ELEMENTARY |
| ENO          | Output status (TRUE: Normal, FALSE: Abnormal)                | Output variable | BOOL           |
| d(LIMIT(_E)) | Output                                                       | Output variable | ANY_ELEMENTARY |

### Processing details

#### ■Operation processing

- These functions output an input value according to the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, or TIME type data input to (s1), (s2), and (s3) in the same data type as (s1), (s2), and (s3) from (d).
  - When the input value of (s2) is larger than the one of (s3), these functions output the input value of (s3) from (d).
  - When the input value of (s2) is smaller than the one of (s1), these functions output the input value of (s1) from (d).
  - When the input value of (s1) ≤ the input value of (s2) ≤ the input value of (s3), these functions output the input value of (s2) from (d).

**Ex.**

Data type is INT

- A data value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, or TIME type can be input to (s1), (s2), and (s3). (The input value of (s1) must be smaller than the one of (s3).)

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1), (s2), and (s3) are INT or WORD

| Error code (SD0/SD8067) | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| 3405H                   | The lower limit value specified by (s1) is greater than the upper limit value specified by (s2). |

- (s1), (s2), and (s3) are DINT, DWORD, or TIME

| Error code (SD0/SD8067) | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| 3405H                   | The lower limit value specified by (s1) is greater than the upper limit value specified by (s2). |

- (s1), (s2), and (s3) are BOOL

| Error code (SD0/SD8067) | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| 3405H                   | The lower limit value specified by (s1) is greater than the upper limit value specified by (s3). |

- (s1), (s2), and (s3) are the REAL type

| Error code (SD0/SD8067) | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| 3402H                   | The value of (s1) is outside the following range.<br>$0, 2^{-126} \leq  (s1)  < 2^{128}$         |
|                         | The data specified by (s1) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .      |
|                         | The value of (s2) is outside the following range.<br>$0, 2^{-126} \leq  (s2)  < 2^{128}$         |
|                         | The data specified by (s2) is -0, denormalized number, NaN (not a number), or $\pm\infty$ .      |
|                         | The value of (s3) is outside the following range.<br>$0, 2^{-126} \leq  (s3)  < 2^{128}$         |

| 3406H                   | The specified character string cannot be stored in a label specified by (d) or devices from specified device number to the end device number of corresponding device. |

# 25.4 Multiplexer

## MUX(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output one of multiple input values.

| Ladder diagram, FBD/LD*1 |               | Structured text*1                                                                    |
|--------------------------|---------------|--------------------------------------------------------------------------------------|
| [Without EN/ENO]         | [With EN/ENO] | <pre>[Without EN/ENO] d:=MUX(n,s1,s2); [With EN/ENO] d:=MUX_E(EN,ENO,n,s1,s2);</pre> |
|                          |               |                                                                                      |

\*1 The input variable "s" can be changed in the range of 2 to 28.

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type |
|----------------------|----------------------------------------------------|-----------------|-----------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| n(K)                 | Output value selection                             | Input variable  | INT       |
| s1(IN0) to s28(IN27) | Input                                              | Input variable  | ANY       |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(MUX(_E))           | Output                                             | Output variable | ANY       |

### Processing details

#### ■Operation processing

- These functions output one of values input to (s1) to (s28) according to the input value of (n) in the same data type as (s) from (d).
- When 0 is input to (n), these functions output a value input to (s1) from (d).
- When (n)-1 is input to (n), these functions output a value input to (sn) from (d).

**Ex.**

Data type is INT

- When a value input to (n) is outside the pin number range for (s), these functions output an indefinite value from (d). (An operation error does not occur. "MUX\_E" outputs "FALSE" from ENO).
- A value input to (n) is the INT type data value and within the range from 0 to 27. (The value must be in the pin number range for (s).)
- A data value of the BOOL, INT, DINT, WORD, DWORD, REAL, STRING, TIME, structure, or array type can be input to (s).

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s1) to (s28) and later, "00H" does not exist.                                                 |

\*1 The input variable "s" can be changed in the range of 2 to 28.

\*2 Supported by engineering tool version "1.035M" and later. In earlier versions, write in operator form. (MELSEC iQ-F FX5 Programming Manual (Program Design))

### Setting data

#### ■ Descriptions, types, and data types

| Argument                                      | Description                                        | Type            | Data type      |
|-----------------------------------------------|----------------------------------------------------|-----------------|----------------|
| EN                                            | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL           |
| s1(IN1) to s28(IN28)                          | Input                                              | Input variable  | ANY_ELEMENTARY |
| ENO                                           | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL           |
| d(GT(_E) / GE(_E) / EQ(_E) / LE(_E) / LT(_E)) | Output (TRUE: True value, FALSE: False value)      | Output variable | BOOL           |

### Processing details

#### ■ Operation processing

- These functions perform a comparison operation of input values of (s) and output operation results from (d) in the BOOL type.
  - GT(\_E): These functions compare  $[(s1) > (s2)] \& [(s2) > (s3)] \& \dots \& [(s)_{(n-1)} > (s)_{(n)}]$ .
    - When all the operation results are  $(s)_{(n-1)} > (s)_{(n)}$ , these functions output TRUE.
    - When any of the operation results is  $(s)_{(n-1)} \leq (s)_{(n)}$ , these functions output FALSE.
  - GE(\_E): These functions compare  $[(s1) \geq (s2)] \& [(s2) \geq (s3)] \& \dots \& [(s)_{(n-1)} \geq (s)_{(n)}]$ .
    - When all the operation results are  $(s)_{(n-1)} \geq (s)_{(n)}$ , these functions output TRUE.
    - When any of the operation result is  $(s)_{(n-1)} < (s)_{(n)}$ , these functions output FALSE.
  - EQ(\_E): These functions compare  $[(s1) = (s2)] \& [(s2) = (s3)] \& \dots \& [(s)_{(n-1)} = (s)_{(n)}]$ .
    - When all the operation results are  $(s)_{(n-1)} = (s)_{(n)}$ , these functions output TRUE.
    - When any of the operation results is  $(s)_{(n-1)} \neq (s)_{(n)}$ , these functions output FALSE.
  - LE(\_E): These functions compare  $[(s1) \leq (s2)] \& [(s2) \leq (s3)] \& \dots \& [(s)_{(n-1)} \leq (s)_{(n)}]$ .
    - When all the operation results are  $(s)_{(n-1)} \leq (s)_{(n)}$ , these functions output TRUE.
    - When any of the operation result is  $(s)_{(n-1)} > (s)_{(n)}$ , these functions output FALSE.
  - LT(\_E): These functions compare  $[(s1) < (s2)] \& [(s2) < (s3)] \& \dots \& [(s)_{(n-1)} < (s)_{(n)}]$ .
    - When all the operation results are  $(s)_{(n-1)} < (s)_{(n)}$ , these functions output TRUE.
    - When any of the operation results is  $(s)_{(n-1)} \geq (s)_{(n)}$ , these functions output FALSE.
- A data value of the INT, DINT, REAL, BOOL, WORD, DWORD, TIME, or STRING type can be input to (s).

## ■ Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) to (s28) are the STRING type

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s1) to (s28) and later, "00H" does not exist.                                                 |
| 3405H                      | The character string specified by (s1) to (s28) has more than 16383 characters.                                                                             |
| 3406H                      | The whole specified character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

- The above errors do not occur in LE(\_E) and LT(\_E)

## 26.2 Compare

### NE(\_E)

26

FX5S

FX5UJ

FX5U

FX5UC

These functions output the data comparison result of input values.

| d(NE(_E))        | Output (TRUE: True value, FALSE: False value)      | Output variable | BOOL           |

### Processing details

#### ■Operation processing

- These functions perform a comparison operation of input values of (s) and output operation results from (d) in the BOOL type.
  - NE(\_E): These functions compare [(s1)≠(s2)].
    - When (s1)≠(s2), these functions output TRUE.
    - These functions output FALSE when (s1)=(s2).
- A data value of the INT, DINT, REAL, BOOL, WORD, DWORD, TIME, or STRING type can be input to (s).

#### ■Operation result

##### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                               |                        |
|---------------------------|------------------------------------------------|------------------------|
| EN                        | ENO                                            | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur)           | Operation output value |
|                           | FALSE (Operation error occurred) <sup>*1</sup> | Indefinite value       |
| FALSE (Stops operation)   | FALSE <sup>*1</sup>                            | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

- (s1) and (s2) are the STRING type

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s) and later, "00H" does not exist.                                                           |
| 3405H                      | The character string specified by (s) has more than 16383 characters.                                                                                       |
| 3406H                      | The whole specified character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 27 CHARACTER STRING FUNCTIONS

## 27.1 Character String Length Detection

### LEN(\_E)

27

FX5S

FX5UJ

FX5U

FX5UC

These functions detect the length of an input character string and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                        |

|  |  |                                                                        |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                        | Type            | Data type   |
|------------|----------------------------------------------------|-----------------|-------------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL        |
| s(IN)      | Input                                              | Input variable  | STRING(255) |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL        |
| d(LEN(_E)) | Output                                             | Output variable | INT         |

### Processing details

#### ■Operation processing

- These functions detect the length of a character string input to (s) and output the result from (d).

|     | High-order byte                                  | Low-order byte                 |                                                                                       |
|-----|--------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------|
| +0  | ASCII code for 2nd character                     | ASCII code for 1st character   |  |
| +1  | ASCII code for 4th character                     | ASCII code for 3rd character   |                                                                                       |
| +2  | ASCII code for 6th character                     | ASCII code for 5th character   |                                                                                       |
| ... | ...                                              | ...                            |                                                                                       |
| +n  | 00H (Indicates the end of the character string.) | ASCII code for (n)th character |                                                                                       |

- A value input to (s) is the STRING type data value and within the range from 0 to 255 byte(s).

#### ■Operation result

##### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

##### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 27.2 Extracting Character String Data from the Left/Right

## LEFT(\_E), RIGHT(\_E)

FX5S    FX5UJ    FX5U    FX5UC

- LEFT(\_E): These functions output specified number of characters from the left of input character string data.
- RIGHT(\_E): These functions output specified number of characters from the right of input character string data.

### Setting data

#### ■Descriptions, types, and data types

| Argument                | Description                                           | Type            | Data type   |
|-------------------------|-------------------------------------------------------|-----------------|-------------|
| EN                      | Execution condition (TRUE: Execution, FALSE: Stop)    | Input variable  | BOOL        |
| s(IN)                   | Input                                                 | Input variable  | STRING(255) |
| n(L)                    | Specification of number of characters to be extracted | Input variable  | INT         |
| ENO                     | Output status (TRUE: Normal, FALSE: Abnormal)         | Output variable | BOOL        |
| d(LEFT(_E) / RIGHT(_E)) | Output                                                | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- LEFT(\_E)  
These functions output the data for the specified number of characters from the left of a character string input to (s) from (d).  
The value input to (n) specifies the number of characters to be extracted.

Ex.

When the value input to (n) is 7

"ABCDEF12345"

High-order byte    Low-order byte

|    |         |         |
|----|---------|---------|
| +0 | 42H (B) | 41H (A) |
| +1 | 44H (D) | 43H (C) |
| +2 | 46H (F) | 45H (E) |
| +3 | 32H (2) | 31H (1) |
| +4 | 34H (4) | 33H (3) |
| +5 | 00H     | 35H (5) |

(1)

➡

"ABCDEF1"

High-order byte    Low-order byte

|         |         |    |
|---------|---------|----|
| 42H (B) | 41H (A) | +0 |
| 44H (D) | 43H (C) | +1 |
| 46H (F) | 45H (E) | +2 |
| 00H     | 31H (1) | +3 |

(1): Number of characters to be extracted (L): 7

• RIGHT(\_E)

These functions output the data for the specified number of characters from the right of a character string input to (s) from (d).  
The value input to (n) specifies the number of characters to be extracted.

**Ex.**

When the value input to (n) is 5

- A value input to (s) is the STRING type data value and within the range from 0 to 255 byte(s).
- A value input to (n) is the INT type data value and within the range from 0 to 255. (However, the value must be within the number of characters of the character string to be input to (s).)

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

There is no operation error.

# 27.3 Extract Mid String

## MID(\_E)

FX5S FX5UJ FX5U FX5UC

These functions output the specified number of characters from an arbitrary position of an input character string.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                    |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=MID(s,n1,n2);<br>[With EN/ENO]<br>d:=MID_E(EN,ENO,s,n1,n2); |
|  |  |                                                                                    |

### Setting data

#### ■Descriptions, types, and data types

| Argument   | Description                                                                    | Type            | Data type   |
|------------|--------------------------------------------------------------------------------|-----------------|-------------|
| EN         | Execution condition (TRUE: Execution, FALSE: Stop)                             | Input variable  | BOOL        |
| s(IN)      | Input                                                                          | Input variable  | STRING(255) |
| n1(L)      | Specification of number of characters to be extracted                          | Input variable  | INT         |
| n2(P)      | Specification of head character position of a character string to be extracted | Input variable  | INT         |
| ENO        | Output status (TRUE: Normal, FALSE: Abnormal)                                  | Output variable | BOOL        |
| d(MID(_E)) | Output                                                                         | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- These functions output the data for the specified number of characters from an arbitrary position of a character string input to (s).
- The value input to (n1) specifies the number of characters to be extracted.
- The value input to (n2) specifies the number of the head character position of a character string to be extracted.

#### Ex.

When the value input to (n1) and (n2) is 5

(1): Head character position of a character string to be extracted n2: 5th character  
(2): Number of characters to be extracted n1: 5

- A value input to (s) is the STRING type data value and within the range from 0 to 255 byte(s).
- A value input to (n1) is the INT type data value and within the range from 0 to 255. (However, the value must be within the number of characters of the character string to be input to (s).)
- A value input to (n2) is the INT type data value and within the range from 1 to 255. (However, the value must be within the number of characters of the character string to be input to (s).)

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s) and later, "00H" does not exist.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3405H                      | <p>The character string specified by (s) has more than 16383 characters.</p> <p>Data outside the allowable range was set to (n1) and (n2).</p> <ul style="list-style-type: none"> <li>• The value stored in a device specified in (n1) and (n2) is 0 or less.</li> <li>• The value stored in a device specified in (n2) is any value other than an effective value (-1, 0, 1, or more).</li> <li>• The value stored in a device specified in (n1) exceeds the number of characters of (s).</li> <li>• The total of the values stored in devices specified in (n1) and (n2) exceeds the number of characters of (s).</li> </ul> |

# 27.4 Link Character Strings

## CONCAT(\_E)

FX5S FX5UJ FX5U FX5UC

These functions concatenate character strings and output the result.

| Ladder diagram, FBD/LD*1 |               | Structured text*1                                                                    |
|--------------------------|---------------|--------------------------------------------------------------------------------------|
| [Without EN/ENO]         | [With EN/ENO] | [Without EN/ENO]<br>d:=CONCAT(s1,s2);<br>[With EN/ENO]<br>d:=CONCAT_E(EN,ENO,s1,s2); |

\*1 The input variable "s" can be changed in the range of 2 to 28.

### Setting data

#### ■Descriptions, types, and data types

| Argument             | Description                                        | Type            | Data type   |
|----------------------|----------------------------------------------------|-----------------|-------------|
| EN                   | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL        |
| s1(IN1) to s28(IN28) | Input                                              | Input variable  | STRING(255) |
| ENO                  | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL        |
| d(CONCAT(_E))        | Output                                             | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- These functions concatenate the character string input to the input variables (s2) to (s28) after the one input to (s1) and output the result from (d).
- When character strings are concatenated, 00H indicating an end of the character string specified by (s1) is ignored and the character string specified by (s2) to (s28) is concatenated.
- When the concatenated character string exceeds 255 bytes, these functions output a character string within 255 bytes.

- A value input to the input variables (s1) and (s2) to (s28) is the STRING type data value and within the range from 0 to 255 byte(s).

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s1) to (s28) and later, "00H" does not exist.                                                    |
| 3406H                      | The whole concatenated character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 27.5 Inserting Character String

## INSERT(\_E)

FX5S FX5UJ FX5U FX5UC

These functions insert a character string into another character string and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  |                                                                                   | [Without EN/ENO]<br>d:=INSERT(s1,s2,n);<br>[With EN/ENO]<br>d:=INSERT_E(EN,ENO,s1,s2,n); |
|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                                                   | Type            | Data type   |
|------------------|-------------------------------------------------------------------------------|-----------------|-------------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop)                            | Input variable  | BOOL        |
| s1(IN1), s2(IN2) | Input                                                                         | Input variable  | STRING(255) |
| n(P)             | Specification of head character position of a character string to be inserted | Input variable  | INT         |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)                                 | Output variable | BOOL        |
| d(INSERT(_E))    | Output                                                                        | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- These functions insert the character string input to (s2) at the (n)th character from the start of the character string input to (s1) (head position of the insertion) and output from (d).
- After the character string specified by (s2) is inserted to the one specified by (s1), 00H indicating an end of the character string specified by (s2) is ignored.
- When the inserted character string exceeds 255 bytes, these functions output a character string within 255 bytes.

Ex.

When the value input to (n) is 4

(1): Head character position of a character string to be inserted n: 4th character

- A value input to (s1) and (s2) is the STRING type data value and within the range from 0 to 255 byte(s).
- A value input to (n) is the INT type data value and within the range from 1 to 255. (However, the value must be within the number of characters of the character string to be input to (s1).)

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | In the corresponding device range of the device specified by (s1) to (s28) and later, "00H" does not exist.                                                    |
| 3406H                      | The whole concatenated character string cannot be stored in the devices from the device specified by (d) to the last device in the corresponding device range. |

# 27.6 Deleting Character String

## DELETE(\_E)

FX5S FX5UJ FX5U FX5UC

These functions delete an arbitrary range of a character string and output the result.

| Ladder diagram, FBD/LD |               | Structured text                                                                          |
|------------------------|---------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]       | [With EN/ENO] | [Without EN/ENO]<br>d:=DELETE(s,n1,n2);<br>[With EN/ENO]<br>d:=DELETE_E(EN,ENO,s,n1,n2); |
|                        |               |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument      | Description                                                                  | Type            | Data type   |
|---------------|------------------------------------------------------------------------------|-----------------|-------------|
| EN            | Execution condition (TRUE: Execution, FALSE: Stop)                           | Input variable  | BOOL        |
| s(IN)         | Input                                                                        | Input variable  | STRING(255) |
| n1(L)         | Specification of number of characters to be deleted                          | Input variable  | INT         |
| n2(P)         | Specification of head character position of a character string to be deleted | Input variable  | INT         |
| ENO           | Output status (TRUE: Normal, FALSE: Abnormal)                                | Output variable | BOOL        |
| d(DELETE(_E)) | Output                                                                       | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- These functions delete the data for the specified number of characters from an arbitrary position of a character string input to (s) and output the remaining character strings from (d).
- The value input to (n1) specifies the number of characters to be deleted.
- The value input to (n2) specifies the number of the head character position of a character string to be deleted.

Ex.

When the value input to (n1) and (n2) is 5

- (1): Head character position of a character string to be deleted n2: 5th character  
(2): Number of characters to be deleted n1: 5

- A value input to (s) is the STRING type data value and within the range from 0 to 255 byte(s).
- A value input to (n1) is the INT type data value and within the range from 0 to 255. (However, the value must be within the number of characters of the character string to be input to (s).)
- A value input to (n2) is the INT type data value and within the range from 1 to 255. (However, the value must be within the number of characters of the character string to be input to (s).)

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | "00H" is not set to devices from the device number specified by (s) to the end device number of corresponding device.                        |
| 3405H                      | The character strings specified by (s) have more than 255 characters.                                                                        |
|                            | The device value specified by (n1) is out of the valid range (0 to 255).                                                                     |
|                            | The device value specified by (n2) is out of the valid range (1 to 255).                                                                     |
|                            | (n1) exceeds the number of characters of a character string specified by (s).                                                                |
|                            | (n2) exceeds the number of characters of a character string specified by (s).                                                                |
| 3406H                      | The whole deleted character string cannot be stored in the devices from the device specified by (d) to the last device of the target device. |

# 27.7 Replacing Character String

## REPLACE(\_E)

FX5S FX5UJ FX5U FX5UC

These functions replace an arbitrary range of a character string and output the result.

| Ladder diagram, FBD/LD                                                                                |                                                                                                    | Structured text                                                                                    |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| [Without EN/ENO]<br> | [With EN/ENO]<br> | [Without EN/ENO]<br>d:=REPLACE(s1,s2,n1,n2);<br>[With EN/ENO]<br>d:=REPLACE_E(EN,ENO,s1,s2,n1,n2); |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                                                   | Type            | Data type   |
|------------------|-------------------------------------------------------------------------------|-----------------|-------------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop)                            | Input variable  | BOOL        |
| s1(IN1), s2(IN2) | Input                                                                         | Input variable  | STRING(255) |
| n1(L)            | Specification of number of characters to be replaced                          | Input variable  | INT         |
| n2(P)            | Specification of head character position of a character string to be replaced | Input variable  | INT         |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)                                 | Output variable | BOOL        |
| d(REPLACE(_E))   | Output                                                                        | Output variable | STRING(255) |

### Processing details

#### ■Operation processing

- These functions replace the data for the specified number of characters from an arbitrary position of a character string input to (s1) with a character string input to (s2) and output from (d).
- The value input to (n1) specifies the number of characters to be replaced.
- The value input to (n2) specifies the number of the head character position of a character string to be replaced.

**Ex.**

When the value input to (n1) and (n2) is 5

(1): Head character position of a character string to be replaced n2: 5th character

(2): Number of characters to be replaced n1: 5

- A value input to (s1) and (s2) is the STRING type data value and within the range from 0 to 255 byte(s).
- A value input to (n1) is the INT type data value and within the range from 0 to 255. (However, the value must be within the number of characters of the character string to be input to (s1).)
- A value input to (n2) is the INT type data value and within the range from 1 to 255. (However, the value must be within the number of characters of the character string to be input to (s1).)

## ■Operation result

### 1. Function without EN/ENO

The following table lists the operation results.

| Operation result            | (d)                    |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d)                    |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)*1   | Indefinite value       |
| FALSE (Stops operation)   | FALSE*1                              | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

## Operation error

| Error code<br>(SD0/SD8067) | Description                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 2820H                      | "00H" is not set to devices from the device number specified by (s1) to the end device number of corresponding device.                       |
|                            | "00H" is not set to devices from the device number specified by (s2) to the end device number of corresponding device.                       |
| 3405H                      | The character strings specified by (s1) have more than 255 characters.                                                                       |
|                            | The character strings specified by (s2) have more than 255 characters.                                                                       |
|                            | The device value specified by (n1) is out of the valid range (0 to 255).                                                                     |
|                            | The device value specified by (n2) is out of the valid range (1 to 255).                                                                     |
|                            | (n1) exceeds the number of characters of a character string specified by (s2).                                                               |
|                            | (n2) exceeds the number of characters of a character string specified by (s1).                                                               |
| 3406H                      | The whole deleted character string cannot be stored in the devices from the device specified by (d) to the last device of the target device. |

# 27.8 Searching Character String

## FIND(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions search for a character string and output the result.

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                  |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=FIND(s1,s2);<br>[With EN/ENO]<br>d:=FIND_E(EN,ENO,s1,s2); |
|  |  |                                                                                  |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                        | Type            | Data type   |
|------------------|----------------------------------------------------|-----------------|-------------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL        |
| s1(IN1), s2(IN2) | Input                                              | Input variable  | STRING(255) |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL        |
| d(FIND(_E))      | Output                                             | Output variable | INT         |

### Processing details

#### ■Operation processing

- These functions search for a character string input to (s2) from the start of the character string input to (s1) and output the result from (d).
- This function outputs the head character position of the searched character string detected first as the search result.
- If a character string specified by (s2) cannot be searched from the one specified by (s1), these functions output "0".

- A value input to (s1) and (s2) is the STRING type data value and within the range from 0 to 255 byte(s).

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

There is no operation error.

# 28 TIME DATA FUNCTIONS

## 28.1 Addition

### ADD\_TIME(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the sum of input values (TIME data) ((s1) + (s2)).

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=ADD_TIME(s1,s2);<br>[With EN/ENO]<br>d:=ADD_TIME_E(EN,ENO,s1,s2); |
|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                        | Type            | Data type |
|------------------|----------------------------------------------------|-----------------|-----------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1), s2(IN2) | Input                                              | Input variable  | TIME      |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(ADD_TIME(_E))  | Output                                             | Output variable | TIME      |

### Processing details

#### ■Operation processing

- These functions add the TIME type data input to (s1) and (s2) ((s1) + (s2)), and output the operation result from (d) as TIME type data.

**Ex.**

When a value input to (s1) and (s2) is T#1d2h33m44s55ms (1 day 2 hours 33 minutes 44 seconds 55 milliseconds) and T#2ms (2 milliseconds)

- A value input to (s1) and (s2) is the TIME type data value.
- Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. The data is output from (d) as follows: "ADD\_TIME\_E" outputs "TRUE" from the output variable ENO.

**Ex.**

Overflow

The most significant bit becomes 1, and a negative time is output.

Ex.

Underflow

The most significant bit becomes 0, and a positive time is output.

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE <sup>*1</sup> | Indefinite value       |

<sup>\*1</sup> When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

28

## Operation error

There is no operation error.

# 28.2 Subtraction

## SUB\_TIME(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the difference of input values (TIME data) ((s1) - (s2)).

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=SUB_TIME(s1,s2);<br>[With EN/ENO]<br>d:=SUB_TIME_E(EN,ENO,s1,s2); |
|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument         | Description                                        | Type            | Data type |
|------------------|----------------------------------------------------|-----------------|-----------|
| EN               | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1), s2(IN2) | Input                                              | Input variable  | TIME      |
| ENO              | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(SUB_TIME(_E))  | Output                                             | Output variable | TIME      |

### Processing details

#### ■Operation processing

- These functions subtract the TIME type data input to (s1) and (s2) ((s1) - (s2)), and output the operation result from (d) as TIME type data.

**Ex.**

When a value input to (s1) and (s2) is T#1d2h33m44s55ms (1 day 2 hours 33 minutes 44 seconds 55 milliseconds) and T#2ms (2 milliseconds)

- A value input to (s1) and (s2) is the TIME type data value.
- Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. The data is output from (d) as follows: "SUB\_TIME\_E" outputs "TRUE" from the output variable ENO.

**Ex.**

Overflow

The most significant bit becomes 1, and a negative time is output.

**Ex.**

Underflow

The most significant bit becomes 0, and a positive time is output.

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

There is no operation error.

# 28.3 Multiplication

## MUL\_TIME(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the multiplication of input values (TIME) ((s1) × (s2)).

| Ladder diagram, FBD/LD                                                            |                                                                                   | Structured text                                                                          |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]                                                                  | [With EN/ENO]                                                                     | [Without EN/ENO]<br>d:=MUL_TIME(s1,s2);<br>[With EN/ENO]<br>d:=MUL_TIME_E(EN,ENO,s1,s2); |
|  |  |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument        | Description                                        | Type            | Data type |
|-----------------|----------------------------------------------------|-----------------|-----------|
| EN              | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1)         | Input                                              | Input variable  | TIME      |
| s2(IN2)         | Input                                              | Input variable  | ANY_NUM   |
| ENO             | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(MUL_TIME(_E)) | Output                                             | Output variable | TIME      |

### Processing details

#### ■Operation processing

- These functions multiply the TIME type data input to (s1) and (s2) ((s1) × (s2)), and output the operation result from (d) as TIME type data.

**Ex.**

When a value input to (s1) and (s2) is T#1d2h33m44s55ms (1 day 2 hours 33 minutes 44 seconds 55 milliseconds) and 2

- A value input to (s1) is the TIME type data value.
- A value input to (s2) is the INT, DINT, or REAL type.
- Even if underflow or overflow occurs in the operation result, it is not regarded as an operation error. The data is output from (d) as follows: "MUL\_TIME\_E" outputs "TRUE" from the output variable ENO. (The operation result is the 64-bit data, however, the output data is the time type data with high-order 32 bits deleted.)

**Ex.**

Overflow

The most significant bit becomes 1, and a negative time is output.

Ex.

Underflow

The most significant bit becomes 0, and a positive time is output.

■Operation result

1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE*1          | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

Operation error

There is no operation error.

# 28.4 Division

## DIV\_TIME(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These functions output the quotient of input values (TIME data) ((s1) ÷ (s2)).

| Ladder diagram, FBD/LD |               | Structured text                                                                          |
|------------------------|---------------|------------------------------------------------------------------------------------------|
| [Without EN/ENO]       | [With EN/ENO] | [Without EN/ENO]<br>d:=DIV_TIME(s1,s2);<br>[With EN/ENO]<br>d:=DIV_TIME_E(EN,ENO,s1,s2); |
|                        |               |                                                                                          |

### Setting data

#### ■Descriptions, types, and data types

| Argument        | Description                                        | Type            | Data type |
|-----------------|----------------------------------------------------|-----------------|-----------|
| EN              | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s1(IN1)         | Input                                              | Input variable  | TIME      |
| s2(IN2)         | Input                                              | Input variable  | ANY_NUM   |
| ENO             | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(DIV_TIME(_E)) | Output                                             | Output variable | TIME      |

### Processing details

#### ■Operation processing

- These functions divide the TIME type data input to (s1) and (s2) ((s1) ÷ (s2)), and output the operation result from (d) as TIME type data. The remainder is ignored.

**Ex.**

When a value input to (s1) and (s2) is T#1d2h33m44s55ms (1 day 2 hours 33 minutes 44 seconds 55 milliseconds) and 2

- A value input to (s1) is the TIME type data value.
- A value input to (s2) is the INT, DINT, or REAL type. (However, input other than 0 to (s2).)

## ■Operation result

### 1. Function without EN/ENO

The operation processing is executed. The operation output value is output from (d).

### 2. Function with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result    |                        |
|---------------------------|---------------------|------------------------|
| EN                        | ENO                 | (d)                    |
| TRUE (Executes operation) | TRUE                | Operation output value |
| FALSE (Stops operation)   | FALSE* <sup>1</sup> | Indefinite value       |

\*1 When FALSE is output from ENO, data output from (d) is undefined. In that case, modify a program so that the data output from (d) is not used.

### Setting data

#### ■Descriptions, types, and data types

| Argument | Description                                        | Type            | Data type |
|----------|----------------------------------------------------|-----------------|-----------|
| EN       | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(CLK)   | Rising edge detector input                         | Input variable  | BOOL      |
| ENO      | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d(Q)     | Output                                             | Output variable | BOOL      |

### Processing details

#### ■Operation processing

When (s) turns ON, (d) is turned ON only for one scan.

#### ■Operation result

##### 1. Function block without EN/ENO

The operation processing is executed. The operation output value is output from (d).

- Timing chart

- (1): On the rising edge of (s), (d) turns on.  
(2): At the next scan, (d) turns off.

2. Function block with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d)                    |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE            | Previous output value  |

• Timing chart

- (1): When EN is on and on the rising edge of (s), (d) turns on.
- (2): At the next scan, (d) turns off.
- (3): When EN is off, (d) holds the output of the previous scan.

Operation error

There is no operation error.

# 30.2 Falling Edge Detector

## F\_TRIG(\_E)

FX5S    FX5UJ    FX5U    FX5UC

These function blocks detect the falling edge of a signal, and output a pulse signal.

| Ladder diagram, FBD/LD |               | Structured text                                                                                            |

## Processing details

### ■Operation processing

#### 1. Count up

- These function blocks count up (add "1" to) the value of (d3) when (s1) turns ON from OFF.
- When the value of (d3) reaches the value of (n), (d1) turns ON and the function blocks stop counting up.
- Set the maximum value of the counter for (n). When (s3) is turned ON, (d1) turns OFF and (d3) is set to 0.

#### 2. Count down

- These function blocks count down (subtract "-1" from) the value of (d3) when (s2) turns ON from OFF.
- When the value of (d3) is 0, (d2) turns ON and the function blocks stop counting down.
- Set the counter start value for (n). When (s4) is turned ON, (d2) turns OFF and (n) is set for (d3).

#### 3. Count maximum value/start value

The effective setting range of (n) is from 0 to 32767.

#### 4. Others

- When (s1) and (s2) are simultaneously turned ON from OFF, (s1) is prioritized and the function blocks count up (add "1" to) the value of (d3).
- When (s3) and (s4) are simultaneously turned ON, (s3) is prioritized and the value of (d3) is set to 0.

## ■ Operation result

### 1. Function block without EN/ENO

The operation processing is executed. The operation output value is output from (d1), (d2), and (d3).

#### • Timing chart

When 3 is specified in n

- (1): When (s1) turns on from off, (d3) counts up.
- (2): When (s3) turns on from off, (d3) is initialized.
- (3): When (s2) turns on from off, (d3) counts down.
- (4): When (s4) turns on from off, (d3) is initialized.

## 2. Function block with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result |                        |
|---------------------------|------------------|------------------------|
| EN                        | ENO              | (d1), (d2), (d3)       |
| TRUE (Executes operation) | TRUE             | Operation output value |
| FALSE (Stops operation)   | FALSE            | Previous output value  |

### • Timing chart

When 3 is specified in n

- (1): When EN is on and (s1) turns on from off, (d3) is counts up.  
(2): When EN is on and (s3) turns on from off, (d3) is cleared to 0.  
(3): When EN is on and (s2) turns on from off, (d3) is counts down.  
(4): When EN is on and (s4) turns on from off, (d3) is initialized.

### Operation error

There is no operation error.

# 31.4 Counter Function Block

## COUNTER\_FB\_M

FX5S FX5UJ FX5U FX5UC

When the execution condition is established, this function block starts counting up.

| Ladder diagram, FBD/LD | Structured text                                                          |
|------------------------|--------------------------------------------------------------------------|
|                        | COUNTER_FB_M_1(Coil:=s1,Preset:=s2,ValueIn:=s3,ValueOut:=d1,Status:=d2); |

### Setting data

#### ■Descriptions, types, and data types

| Argument     | Description                                        | Type            | Data type |
|--------------|----------------------------------------------------|-----------------|-----------|
| s1(Coil)     | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s2(Preset)   | Counter set value                                  | Input variable  | INT       |
| s3(ValueIn)  | Counter initial value                              | Input variable  | INT       |

| d2(Status)   | Output                                             | Output variable | BOOL      |

### Processing details

#### ■Operation processing

- The counter starts counting when detecting the rising edge (from OFF to ON) of (s1). It does not start counting if (s1) remains ON. The counting is started from the value of (s3). When the count value reaches the value of (s2), (d2) turns ON. The current count value is stored in (d1).
- A value in the range of 0 to 32767 can be specified for (s2).
- A value in the range of -32768 to 32767 can be specified for (s3). However, when a negative value is specified, the initial value is set to 0.
- To reset the current value of the counter (d1), reset (s1) of FB directly.

### Setting data

#### ■Descriptions, types, and data types

| Argument | Description                                        | Type            | Data type |
|----------|----------------------------------------------------|-----------------|-----------|
| EN       | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)    | Output start                                       | Input variable  | BOOL      |
| n(PT)    | Output time setting value                          | Input variable  | TIME      |
| ENO      | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d1(Q)    | Output                                             | Output variable | BOOL      |
| d2(ET)   | Elapsed time                                       | Output variable | TIME      |

### Processing details

#### ■Operation processing

##### 1. Output

- When (s) turns on, (d1) turns on for the time specified by (n). The elapsed time from when (d1) is turned on is set for (d2).
- The timer device is used for counting the elapsed time.

##### 2. End of output

- (d1) turns off when the elapsed time reaches the set value.
- If (s) is off after (d1) is turned off, the elapsed time is reset.
- Even if (s) is turned off when (d1) is on, (d1) is not turned off.

##### 3. Setting of output time

The effective setting range of (n) is from 0 ms to 32767 ms. For TP(\_E), the output time value of (n) is set in units of 100 ms or more. For TP\_10(\_E), it is set in units of 10 ms or more.

The value of when (d1) is turned on from off (rising edge) is used for the setting value of (n). If the value of (n) is changed while (d1) is on, the changed value becomes valid at the next output start.

## ■ Operation result

### 1. Function block without EN/ENO

The following table lists the operation results.

| Operation result            | (d1), (d2)             |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

#### • Timing chart

When T#5s (5 seconds) is specified in n

(1): When (s) is on, (d1) turns on. When (s) is on, the time measurement of (d2) starts.

(2): When (d2) reaches the time specified by n, (d1) turns off.

(3): When (s) and (d1) are off, (d2) is initialized.

### 2. Function block with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d1), (d2)             |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)     | Indefinite value       |
| FALSE (Stops operation)   | FALSE                                | Previous output value  |

#### • Timing chart

When T#5s (5 seconds) is specified in n

(1): When EN and (s) are on, (d1) turns on. When EN and (s) are on, the time measurement of (d2) starts.

(2): After the time measurement starts, the measurement time counts up when EN is on.

(3): When EN is on and (s) and (d1) are off, (d2) is initialized.

(4): When (d2) reaches the time specified by n, (d1) turns off.

## Precautions

If the set value of the output time exceeds the effective range, the program will not operate correctly.

## Operation error

There is no operation error.

# 32.2 On-delay Timer

## TON(\_E), TON\_10(\_E)

**FX5S** **FX5UJ** **FX5U** **FX5UC**

These function blocks turn on a signal after a specified time.

|  |  |                                                                                                                                                                                                                                             |

### Setting data

#### ■Descriptions, types, and data types

| Argument | Description                                        | Type            | Data type |
|----------|----------------------------------------------------|-----------------|-----------|
| EN       | Execution condition (TRUE: Execution, FALSE: Stop) | Input variable  | BOOL      |
| s(IN)    | Time measurement                                   | Input variable  | BOOL      |
| n(PT)    | Delay time setting value                           | Input variable  | TIME      |
| ENO      | Output status (TRUE: Normal, FALSE: Abnormal)      | Output variable | BOOL      |
| d1(Q)    | Output                                             | Output variable | BOOL      |
| d2(ET)   | Elapsed time                                       | Output variable | TIME      |

### Processing details

#### ■Operation processing

##### 1. Output

- When (s) turns on, (d1) is turned on after the time specified by (n). The delay elapsed time from when (s) is turned on is set for (d2).
- When (s) is turned off, (d1) is turned off and the delay elapsed time is reset.
- The timer device is used for counting the elapsed time.

##### 2. Setting of delay time

The effective setting range of (n) is from 0 ms to 32767 ms. For TON(\_E), the output time value of (n) is set in units of 100 ms or more. For TON\_10(\_E), it is set in units of 10 ms or more.

The value of when (s) is turned on from off (rising edge) is used for the setting value of (n). If the value of (n) is changed while (s) is on, the changed value becomes valid on the next rising edge of (s).

## ■ Operation result

### 1. Function block without EN/ENO

The following table lists the operation results.

| Operation result            | (d1), (d2)             |
|-----------------------------|------------------------|
| No operation error occurred | Operation output value |
| An operation error occurred | Indefinite value       |

#### • Timing chart

When T#5s (5 seconds) is specified in n

- (1): When (s) is on, the time measurement of (d2) starts.  
 (2): When (d2) reaches the time specified by n, (d1) turns on.  
 (3): On the falling edge of (s), (d2) is reset.

### 2. Function block with EN/ENO

The following table lists the execution conditions and operation results.

| Execution condition       | Operation result                     |                        |
|---------------------------|--------------------------------------|------------------------|
| EN                        | ENO                                  | (d1), (d2)             |
| TRUE (Executes operation) | TRUE (Operation error did not occur) | Operation output value |
|                           | FALSE (Operation error occurred)     | Previous output value  |
| FALSE (Stops operation)   | FALSE                                | Previous output value  |

#### • Timing chart

- (1): When EN and (s) are on, the time measurement of (d2) starts.  
 (2): When (d2) reaches the time specified by n, (d1) turns on.  
 (3): When EN is on and (s) is off, (d1) turns off and (d2) is reset.

## Precautions

If the set value of the output time exceeds the effective range, the program will not operate correctly.

## Operation error

There is no operation error.

# 32.3 Off-delay Timer

[Timing chart]

# ■TIMER\_CONT\_FB\_M

- This is a retentive timer that counts the time when the variable is on. When the execution condition of (s1) turns on, counting the current value starts. There are two retentive timers: low-speed (TIMER\_CONT\_FB\_M) and highspeed (TIMER\_CONTHS\_FB\_M) retentive timers.
- The timer starts counting from "(s3) × 100 ms"( or 1 ms if the high-speed retentive timer is used). When it counts up to "(s2) × 100 ms"( or 1 ms if the high-speed retentive timer is used), (d2) turns on. The current measurement value is output into (d1).
- The on/off status of (d1) and (d2) is maintained even if the execution condition of (s1) turns off. When the execution condition of (s1) turns on, the timer resume counting from the measurement it holds.
- A value in the range of 0 to 32767 can be specified for (s2).
- A value in the range of -32768 to 32767 can be specified for (s3). However, when a negative value is specified, the initial value is set to 0.
- To reset (d1) of the retentive timer, reset (s1) of FB directly.

## Ex.

For label name TIMER\_CONT\_FB\_M\_1

[Ladder program]

[ST]

RST(M0,TIMER\_CONT\_FB\_M\_1.Coil)

[Ladder example]

[Timing chart]

## Operation error

There is no error.

# APPENDIX

## Appendix 1 Instruction Processing Time

### Instruction processing time (High-speed instruction)

The following table shows instruction processing time of each instruction.

Because the instruction processing time slightly varies depending on the contents of the source and destination, refer to the values in the table as a reference.

| Instruction name | Condition | FX5S CPU module                       |                                   | FX5UJ CPU module                      |                                   | FX5U/FX5UC CPU module                 |                                   |                                        |                                   |
|------------------|-----------|---------------------------------------|-----------------------------------|---------------------------------------|-----------------------------------|---------------------------------------|-----------------------------------|----------------------------------------|-----------------------------------|

# Instruction processing time

The following table shows instruction processing time of each instruction.

Because the instruction processing time slightly varies depending on the contents of the source and destination, refer to the values in the table as a reference. Since the version supporting the SFC program, the processing time of the some instructions will become longer than the conventional processing time. ( Page 1454 Added and Changed Functions)

\*1 The value in the parentheses is the value before supporting the SFC program.

## Appendix 2 Number of Instruction Steps

The number of instruction steps are shown below.

The number of steps may increase depending on the contents of the source and destination (such as specification of BFM or character string), bit specification of word device, digit specification of bit devices, indexing etc. Note that when the number of steps increases, the instruction processing time increases.

| Instruction name | Number of minimum steps |
|------------------|-------------------------|

# Appendix 3 Added and Changed Functions

The functions added or changed with the CPU module and engineering tool, and the supported CPU modules' firmware version and engineering tool software version are given below.

Firmware version can be checked through the module diagnostics (CPU diagnostics). For the module diagnostics (CPU diagnostics), refer to the following manuals.

📖 MELSEC iQ-F FX5S/FX5UJ/FX5U/FX5UC User's Manual (Hardware)

For software version, refer to 📖 GX Works3 Operating Manual.

## FX5S CPU module

| Add/Change Function                                                                    | Supported CPU module firmware version | Supported engineering tool software version | Reference                                  |
|----------------------------------------------------------------------------------------|---------------------------------------|---------------------------------------------|--------------------------------------------|
| FX5S CPU module is supported.                                                          | From first production                 | "1.080J" or later                           | —                                          |
| The SFC program instruction is supported.                                              | "1.010" or later                      | "1.095Z" or later                           | Page 956 SFC PROGRAM INSTRUCTIONS          |
| The number of channels on master stations for MODBUS RTU read/write has been expanded. | "1.050" or later                      | "1.115V" or later                           | Page 1127 MODBUS Communication Instruction |

## FX5UJ CPU module

| Add/Change Function                                                                                                | Supported CPU module firmware version | Supported engineering tool software version | Reference                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| FX5UJ CPU module is supported.                                                                                     | From first production                 | "1.060N" or later                           | —                                                                                                                                                      |
| File operation instructions are supported.                                                                         | "1.030" or later                      | "1.085P" or later                           | Page 486 SP.FREAD<br>Page 512 SP.FWRITE<br>Page 535 SP.FDELETE<br>Page 543 SP.FCOPY<br>Page 553 SP.FMOVE<br>Page 563 SP.FRENAME<br>Page 571 SP.FSTATUS |

# WARRANTY

Please confirm the following product warranty details before using this product.

## 1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company. However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

### [Gratis Warranty Term]

The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

### [Gratis Warranty Range]

- (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
- (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
  1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
  2. Failure caused by unapproved modifications, etc., to the product by the user.
  3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
  4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
  5. Relay failure or output contact failure caused by usage beyond the specified life of contact (cycles).
  6. Failure caused by external irresistible forces such as fires or abnormal voltages, and failure caused by force majeure such as earthquakes, lightning, wind and water damage.
  7. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
  8. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

## 2. Onerous repair term after discontinuation of production

- (1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued.  
Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
- (2) Product supply (including repair parts) is not available after production is discontinued.

## 3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

## 4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

## 5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

## 6. Product application

- (1) In using the Mitsubishi MELSEC programmable controller, the usage conditions shall be that the application will not lead to a major accident even if any problem or fault should occur in the programmable controller device, and that backup and fail-safe functions are systematically provided outside of the device for any problem or fault.
- (2) The Mitsubishi programmable controller has been designed and manufactured for applications in general industries, etc. Thus, applications in which the public could be affected such as in nuclear power plants and other power plants operated by respective power companies, and applications in which a special quality assurance system is required, such as for railway companies or public service purposes shall be excluded from the programmable controller applications.  
In addition, applications in which human life or property that could be greatly affected, such as in aircraft, medical applications, incineration and fuel devices, manned transportation, equipment for recreation and amusement, and safety devices, shall also be excluded from the programmable controller range of applications. However, in certain cases, some applications may be possible, providing the user consults their local Mitsubishi representative outlining the special requirements of the project, and providing that all parties concerned agree to the special circumstances, solely at the user's discretion.
- (3) Mitsubishi shall have no responsibility or liability for any problems involving programmable controller trouble and system trouble caused by DoS attacks, unauthorized access, computer viruses, and other cyberattacks.
