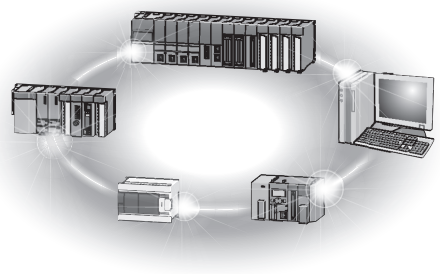
CC-Link System Compact Type Remote I/O Module User's Manual



• SAFETY PRECAUTIONS •

(Read these precautions before using this product.)

Before using this product, please read this manual and the relevant manuals carefully and pay full attention to safety to handle the product correctly.
The precautions given in this manual are concerned with this product. For the safety precautions of the programmable controller system, refer to the user's manual for the CPU module used.
In this manual, the safety precautions are classified into two levels: "⚠ WARNING " and "⚠ CAUTION".

⚠ WARNING	Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.
⚠ CAUTION	Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.

Under some circumstances, failure to observe the precautions given under "⚠CAUTION" may lead to serious consequences.
Observe the precautions of both levels because they are important for personal and system safety.

Make sure that the end users read this manual and then keep the manual in a safe place for future reference.

[Design Precautions]

⚠ WARNING

- In the case of a communication failure in the network, the status of the error station will be as follows:
  (1) All inputs from remote I/O stations are turned off.
  (2) All outputs from remote I/O stations are turned off.
  Check the communication status information and configure an interlock circuit in the sequence program to ensure that the entire system will operate safely.
  Incorrect output or malfunction due to a communication failure may result in an accident.
- Outputs may remain on or off due to a failure of a remote I/O module. Configure an external circuit for monitoring output signals that could cause a serious accident.

⚠ CAUTION

- Use the module in an environment that meets the general specifications in this manual.
  Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100mm (3.94 inches) or more between them. Failure to do so may result in malfunction due to noise.

[Installation Precautions]

⚠ CAUTION

- Do not directly touch any conductive parts of the module. Doing so can cause malfunction or failure of the module.
- Securely fix the module with a DIN rail or mounting screws. Tighten the screws within the specified torque range. Undertightening can cause drop of the screw, short circuit or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
- Securely connect the cable connectors. Poor contact may cause malfunction.

[Wiring Precautions]

⚠ WARNING

- Shut off the external power supply for the system in all phases before wiring.
  Failure to do so may result in electric shock or cause the module to fail or malfunction.

⚠ CAUTION

- Individually ground the FG terminal of the programmable controller with a ground resistance of 100Ω or less. Failure to do so may result in electric shock or malfunction.
- Tighten any unused terminal screws within the specified torque range (0.42 to 0.50N•m). Failure to do so may cause a short circuit due to contact with a solderless terminal.
- Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
- Check the rated voltage and terminal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause a fire or failure.
- Tighten the terminal screw within the specified torque range. Undertightening can cause short circuit, fire, or malfunction. Overtightening can damage the screw and/ or module, resulting in drop, short circuit, fire, or malfunction.
- When fixing the CC-Link dedicated cable and the power cable through the pipes for transmission or power supply line of the waterproof type remote I/O module, securely tighten the nuts with a wrench. Undertightening can cause water intrusion, resulting in failure. (AJ65SBTW□-16□ only.)
- Tighten the communication adapter mounting screw or the waterproof cap within the specified torque range. Undertightening can cause short circuit, fire, or malfunction. Overtightening can damage the screw or the cap, resulting in short circuit or malfunction. (AJ65FBTA□-16□ only.)
- This product meets IP67 standard under the condition that the waterproof plugs, waterproof caps, and communication adapter are all installed. (AJ65FBTA□-16□ only.)
- Do not connect the cable to an incorrect connector. The I/O connector, communication connector, and power connector have the same interface. Doing so can cause malfunction or failure of the module. (AJ65FBTA□-16□ only.)

[Wiring Precautions]

⚠ CAUTION

- Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
- Place the cables in a duct or clamp them. If not, dangling cable may swing or inadvertently be pulled, resulting in damage to the module or cables or malfunction due to poor contact.
- Do not install the control lines together with the communication cables, or bring them close to each other. Failure to do so may cause malfunctions due to noise.
- When an overcurrent caused by an error of an external device or a failure of the programmable controller flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
- When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.

[Starting and Maintenance Precautions]

⚠ WARNING

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
- Shut off the external power supply for the system in all phases before cleaning the module or retightening the terminal screws or module mounting screws. Failure to do so may result in electric shock.
- Set the sink/source selector switch after shutting off the power supply at all phases. Failure to do so may result in failures or malfunctions in the opponent device.

⚠ CAUTION

- Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
- Do not drop or apply strong shock to the module. Doing so may damage the module.
- Shut off the external power supply for the system in all phases before mounting or removing a module. Failure to do so may cause the module to fail or malfunction.
- After the first use of the product, do not mount/remove the terminal block to/from the module more than 50 times (IEC 61131-2 compliant).
- Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Failure to do so may cause the module to fail or malfunction.

[Disposal Precautions]

⚠ CAUTION

- When disposing of this product, treat it as industrial waste.

1 OVERVIEW

This manual describes the specifications of the compact remote I/O module (hereinafter referred to as the "compact remote I/O module") used as the remote I/O station of the CC-Link system.

1.1 Features

The following are the features of the compact remote I/O module:

(1) The remote I/O module is reduced in size yet retains all the functions of the conventional module

The conventional remote I/O module has furthermore been reduced in size.

(2) More models in the compact remote I/O module lineup

The compact remote I/O modules for the CC-Link system is divided into six types including terminal block type, one-touch connector type, waterproof-type, FCN connector type, spring clamp terminal block type, and sensor connector (e-CON) type.

In addition, the number of I/O points is divided into three types (8 points, 16 points, and 32 points), allowing the user to select a module that is most appropriate for the environment and objective.

(3) 4-wire compact remote I/O module featuring easy connection of a 4-wire sensor

A 4-wire sensor can be easily connected via the common pin provided on each plug without installing a relay terminal block.

For a 4-wire compact remote I/O module, one sensor is connected to each plug. Therefore, sensors can be exchanged by plug, reducing work steps.

(4) Terminal block connection provides easy connection of 2-wire and 3-wire sensors or loads

Since the terminal block connection allows connection of 2-wire and 3-wire sensors or loads, common connections are not needed and it makes connection easier.

(5) Wiring work can be minimized

(a) Terminal-block module
The number of wiring steps can be dramatically reduced by adopting the use of self-tightening screws on the terminal block.

(b) One-touch connector module, connector module
The number of wiring steps can be dramatically reduced by adopting use of the pressure-displacement wire-connection method (soldering, peeling of shield and screwing not necessary).

(c) FCN connector module
The number of wiring steps can be dramatically reduced by adopting 40-pin connector for I/O part.

(d) Spring clamp terminal block module
The number of wiring steps can be dramatically reduced by adopting spring clamps (screwing not necessary).

The round solderless terminal can be connected simply by loosening the screw on the terminal block.

(6) Waterproof remote I/O modules with improved resistance against water and oil
The waterproof remote I/O module, low profile waterproof remote I/O module adopts a protection structure compatible with IP67, providing even safer usage in areas in which water and oil are present.

(7) Up to a maximum of 64 remote I/O modules can be connected

In the CC-Link system, a maximum of 64 remote I/O modules can be connected per master station.
Since each remote I/O module occupies 32 points, a maximum of 2048 link points can be set.

(8) Modules can be exchanged without stopping the CC-Link system

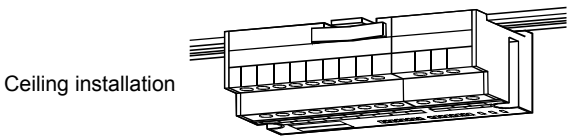
With the adoption of a two-piece terminal block for the CC-Link cable connection, modules may be exchanged without stopping the CC-Link system.

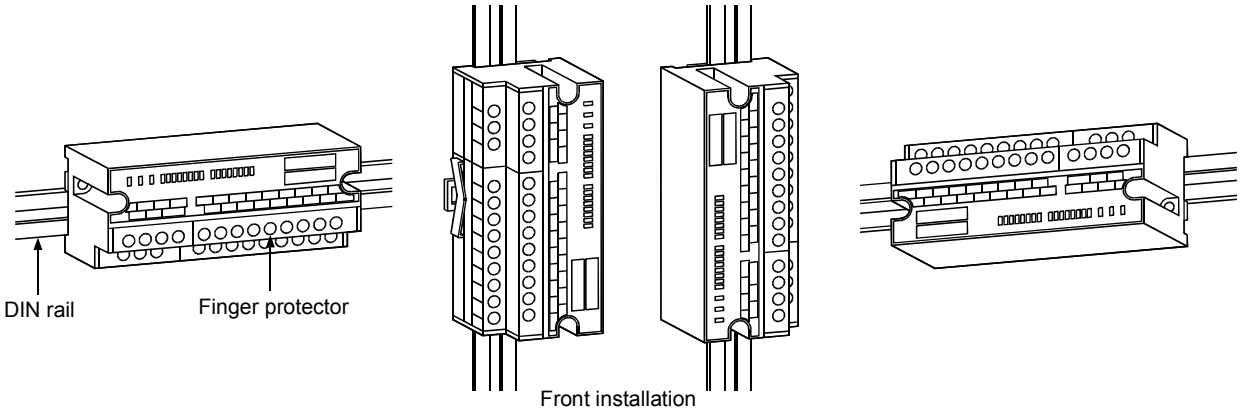
(9) Direct installation to the machine is feasible

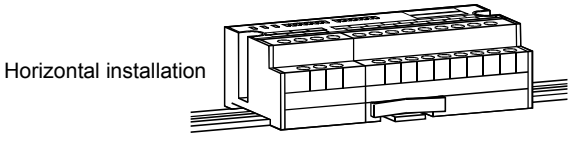
The terminal-block remote I/O module may be installed directly to the machine, since the charged area is protected by a finger protector in the upper area of the terminal block.

(10) The module can be installed in six orientations

The compact remote I/O module can be installed in six different orientations. (Restrictions may apply to some installation orientations.)
The module can also be installed using the DIN rail.





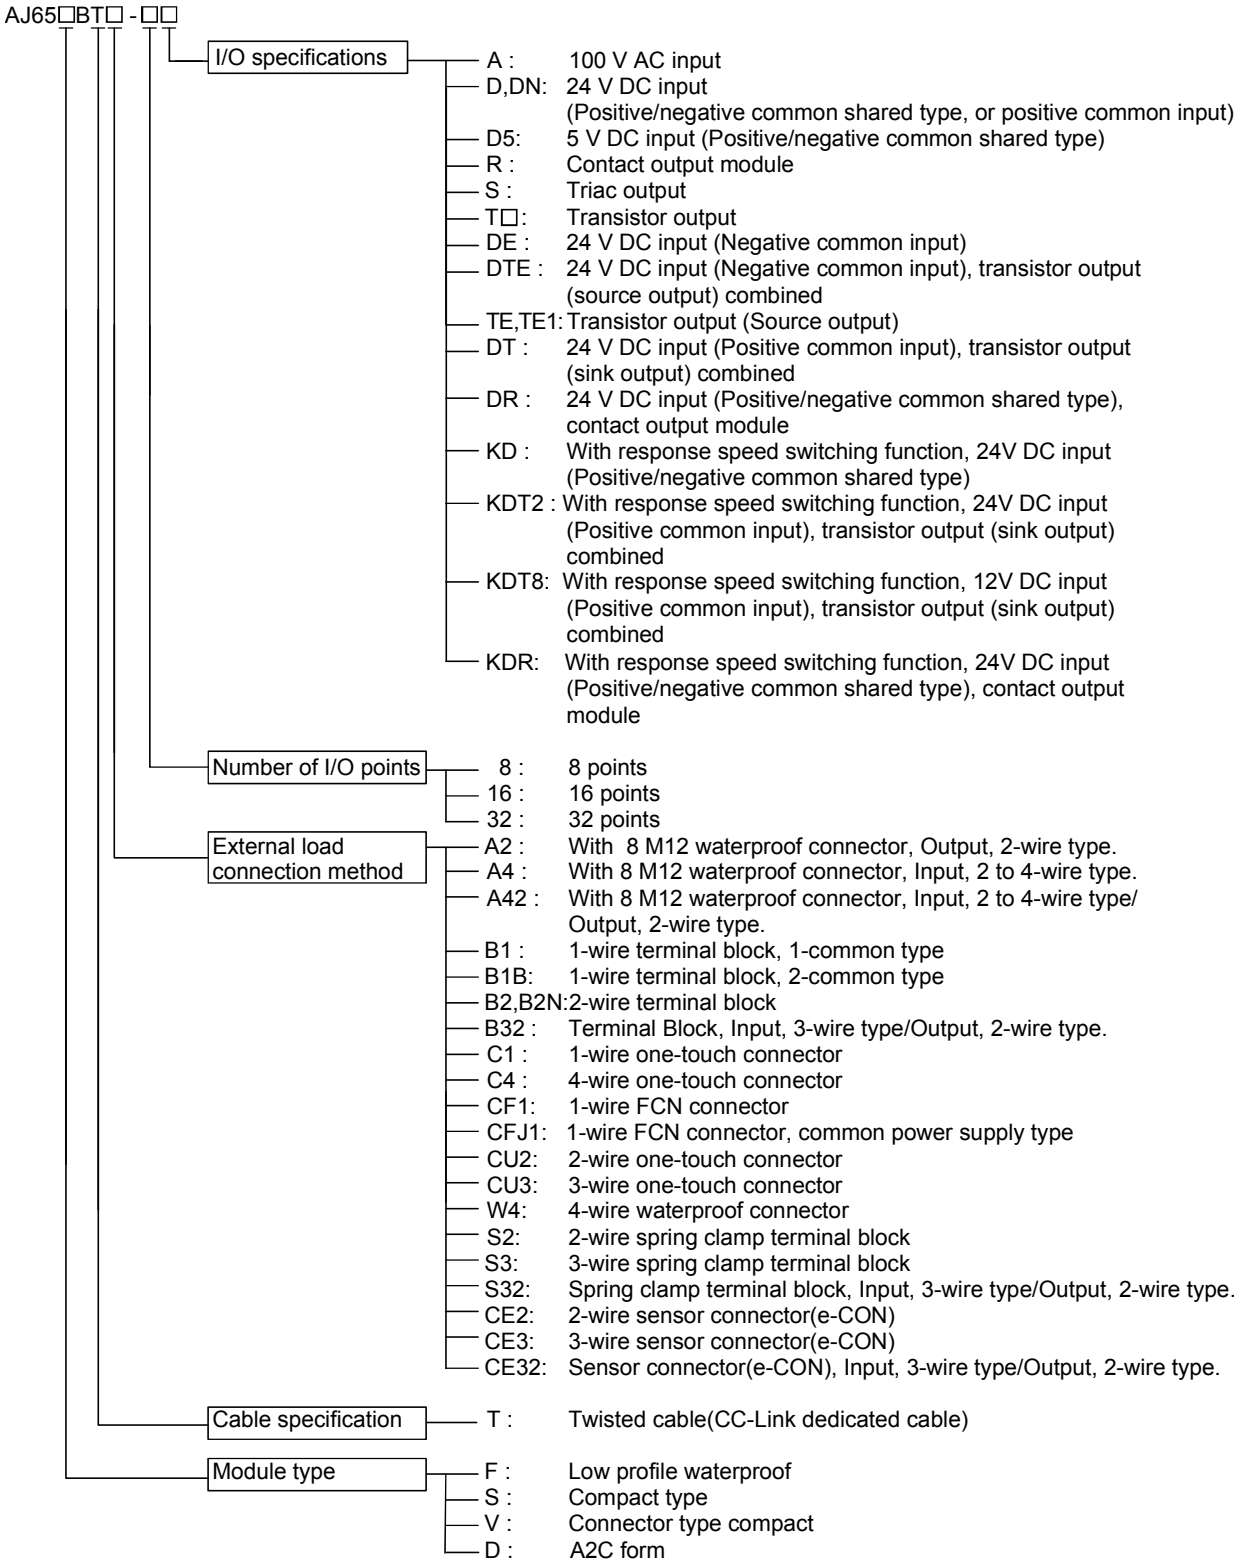


(11) Transistor output module with improved protection functions

The transistor output module is designed to achieve an even greater degree of module protection by adopting overload protection, overheat protection and overvoltage protection as standard. As a result, the programmable controller system's reliability is further improved.

1.2 Identifying the Compact Remote I/O Module Type

The following shows how to identify the type of a compact remote I/O module:



1.3 Precautions for use of remote I/O modules

This section describes the precautions for use of remote I/O modules applicable in the CC-Link system and their specifications.

- This is a remote I/O module designed specifically for the CC-Link system. Do not connect the module to other data-link systems, such as the MELSECNET/MINI.
- 32 points are assigned per station for a compact remote I/O module. For 16-point modules the 16 points in the second half and for 8-points module the 24 points in the second half remain empty but are not usable.
- Do not install the main circuit lines, high-voltage cables, and load cables other than those connected to the programmable controller together. If doing so, the remote I/O module (especially, AJ65SBTB1-16D1, AJ65SBTB1-32D1, AJ65VBTCU3-8D1, AJ65VBTCU3-16D1, and AJ65SBTC1-32D1) will be susceptible to noise, surge, and induction.
- When a mechanical contact, such as a relay, is connected to the AJ65SBTB1-16D1, AJ65SBTB1-32D1, AJ65VBTCU3-8D1, AJ65VBTCU3-16D1, or AJ65SBTC1-32D1, chattering may be input as a signal.

1.3.1 Input module

(1) Input response time and pulse width

The input module may take noise for inputs due to the signal pulse width. The pulse width of the AJ65SBTB1-32KD□, AJ65SBTB3-16KD□, or AJ65SBTB32-16KD□ is as shown in the following table depending on the response speed set by the input response speed switching switch. In case of setting the response speed, fully consider the operating environment.

Response speed setting value (ms)	Minimum value of pulse width that can take noise for inputs (ms)
0.2	0.006
1.5	0.8
5	3
10	6

When setting “0.2ms” as the response speed under an environment with noise, an input signal line (including a common line) should be 3m or less.

(2) Precautions when using the DC input module

(a) Measures against back EMF

When an inductive load is connected, connect a diode to the load in parallel. Use a diode that meets the following conditions.

- Reverse breakdown voltage is equal to or more than 10 times as large as the circuit voltage.
- Forward current is equal to or more than 2 times as large as the load current.

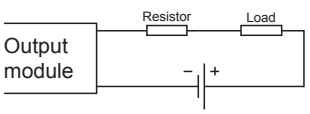
(11) Precautions when using a 3-wire or 4-wire module
When supplying power from a 3-wire or 4-wire module to an external device, such as a sensor, total current must be equal to or less than the value of "supply current for connected device" specified for the module.

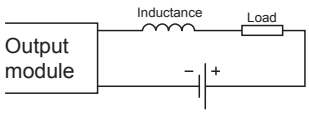
1.3.2 Output module

(1) Maximum switching frequency when the module drives inductive load
The output must be on for one second or longer and off for one second or longer.

(2) Load for connection
When connecting a counter or timer that has a DC-DC converter to a transistor output module (maximum load current 0.1A) as a load, select an output module whose maximum load current is larger than inrush current of the load.
Selecting an output module by average current of the load may cause a failure of the module because inrush current flows at a constant frequency at power-on or during operation due to the connected load.
If an output module needs to be selected by average current of the load, take either of the following actions to reduce an influence from inrush current.



• Connecting a resistor to the load in series



• Connecting an inductor to the load in series

(3) Precaution for using the transistor output module

(a) Action against reverse current

If a transistor output module is wired as shown below, reverse current flows in an output element, causing a failure of the element.
When wiring a transistor output module, connect a diode as shown below.

• When connecting transistor output modules in parallel

• When incorporating an additional circuit parallel to a transistor output module

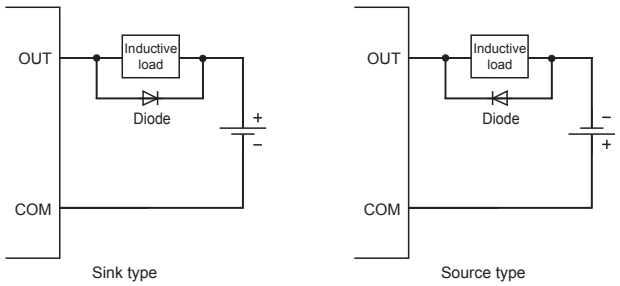
(b) Measures against back EMF

When an inductive load is connected, connect a diode to the load in parallel. Use a diode that meets the following conditions.

- Reverse breakdown voltage is equal to or more than 10 times as large as the circuit voltage.
- Forward current is equal to or more than 2 times as large as the load current.



(4) Modules that require an external short-circuit protection circuit

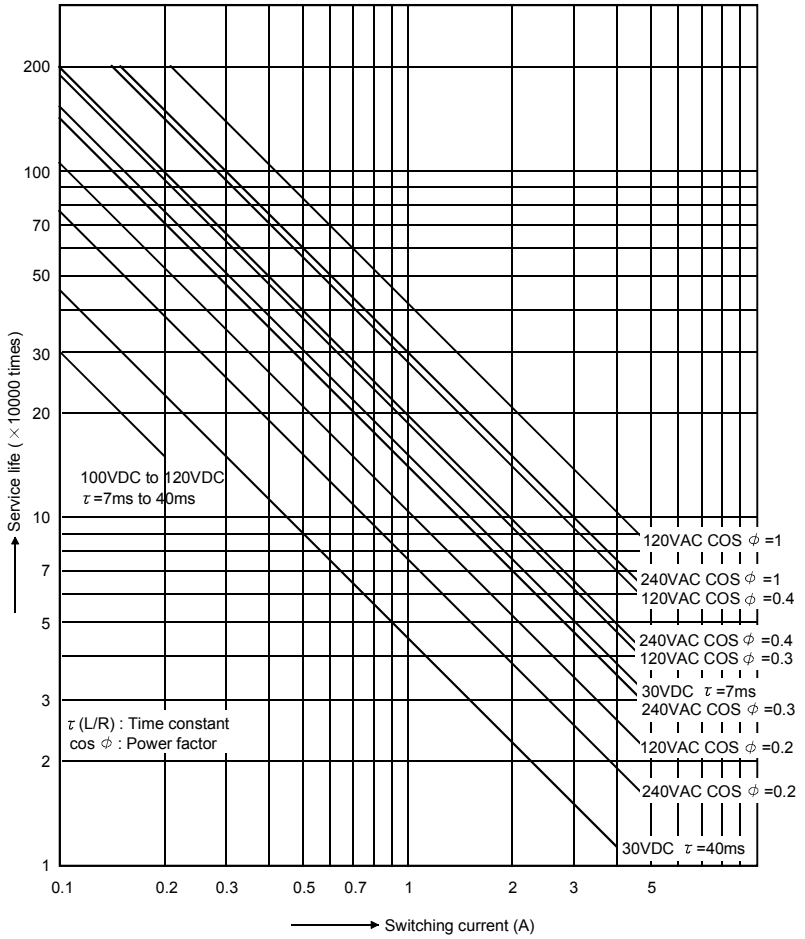
The following modules have no short-circuit protection function. Configure a short-circuit protection circuit external to the programmable controller when they are used.

• AJ65SBTB1-8T1	• AJ65SBTB2-8T1	• AJ65SBTB1-16T1	• AJ65SBTB2-16T1
• AJ65SBTB1B-16TE1	• AJ65VBTS2-16T	• AJ65SBTB1-32T1	• AJ65SBTB1-32TE1
• AJ65DBTB1-32T1	• AJ65VBTS2-32T	• AJ65SBTC1-32T1	
• AJ65SBTB32-8DT2	• AJ65SBTB1-16DT2	• AJ65SBTB1-16DT3	• AJ65SBTB32-16DT2
• AJ65SBTB32-16KDT2	• AJ65SBTB32-16KDT8	• AJ65SBTB1-32DT2	• AJ65SBTB1-32KDT2
• AJ65SBTB1-32DT3	• AJ65SBTB1-32KDT8	• AJ65SBTB1-32DTE1	• AJ65DBTB1-32DT1
• AJ65VBTS32-16DT	• AJ65VBTS32-32DT	• AJ65SBTC4-16DT2	• AJ65SBTC1-32DT2
• AJ65SBTC1-32DT3			

(5) Precautions when using a 3-wire module
When supplying power from a 3-wire module to an external device, such as a sensor, the total current value must be equal to or less than the value of "supply current for connected device" specified for the module.

(6) Precautions for using the contact output module
When using the contact output module, consider the following.
- Relay life
- Effects to relay life due to connected load
- Measures against back EMF

(a) Relay life
Applicable module: AJ65SBTB2N-8R, AJ65SBTB2N-16R,
AJ65DBTB1-32R, AJ65DBTB1-32DR
The relay life depends on the operating environment. Select a module according to the operating environment. The relay lives shown below are the actual service values, not the guaranteed values. Replace the module well in advance since the actual switching life may be shorter than the one shown below.



Operating environment	Switching life
Rated switching voltage/current, rated load	100 thousand times
200VAC 1.5A, 240VAC 1A (COS ϕ =0.7)	100 thousand times
200VAC 1A, 240VAC 0.5A (COS ϕ =0.35)	100 thousand times
24VDC 1A, 100VDC 0.1A (L/R=7ms)	100 thousand times

POINT
When using the module for the application in which the relay contact is frequently switched, the relay life span should be considered. Therefore, it is recommended to use a triac output module.

(b) Effects to relay life due to connected load

The actual relay life may be significantly shortened compared to the one shown above, depending on the type of a load connected and the characteristics of inrush current.
Also, the inrush current may cause contact welding.
Take the following measures to prevent shortening of the relay life and the contact welding.

- Select a load so that the inrush current will be within the rated current of the module.
- Connect an external relay that can withstand the inrush current.

The following table shows the relation between the load and the inrush current.
Select a load so that the inrush current (i) and the rated current (io) will be within the rated switching current specified for the output module used.
The inrush current may flow for a longer time depending on the load.

Load type	Signal waveform diagram	Inrush current (i)/rated current (io)	Signal waveform diagram	Inrush current (i)/rated current (io)
Inductive load	Load of a solenoid  0.07 to 0.1 seconds	Approx. 10 to 20 times	Load of an electromagnetic contactor  	Approx. 3 to 10 times
Lamp load	Load of an incandescent bulb  	Approx. 3 to 10 times	Load of a mercury lamp  	Approx. 3 times*1
	Load of a fluorescent  	Approx. 5 to 10 times	—	—
Capacitive load	Capacitive load*2  	Approx. 20 to 40 times	—	—

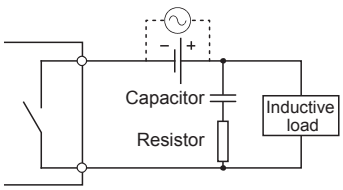
(c) Measures against back EMF

Configure a contact protection circuit for extending the contact life, preventing noise when the contact is cut off, and suppressing the generation of carbide and nitric acid due to arc discharge.

An Incorrect contact protection circuit may cause contact welding.

Also, when using the contact protection circuit, the recovery time may be long.

The following table shows the representative examples of the contact protection circuit.

Circuit example		Method for selecting elements	Remarks
Capacitor + Resistor method (CR method)		Refer to the following for constants of the capacitor and resistor. Note that the following values may differ depending on a nature of the load and a variation of characteristics of it. • Capacitor 0.5 to 1 (μF) against contact current of 1A • Resistor 0.5 to 1 (Ω) against contact voltage of 1V Use a capacitor whose withstand voltage is 200 to 300V. In AC circuit, use a capacitor having no polarity.	If a load is from a relay or solenoid, the recovery time delays. A capacitor suppresses electric discharge while a contact is off, and a resistor restricts a flow of current while a contact is on.
			


Diode method		Use a diode that meets both conditions shown below. • Reverse breakdown voltage is equal to or more than 10 times as large as the circuit voltage. • The forward current is equal to or more than 2 times as large as the load current.	The recovery time is later than the CR method.
Diode + Zener diode method		Use zener voltage for the zener diode equal to or more than the power supply voltage.	The diode method is effective when the recovery time is too late.

*1: When using AC power, impedance of CR must be larger enough than that of the load. (prevention of a malfunction due to leak current from the CR)

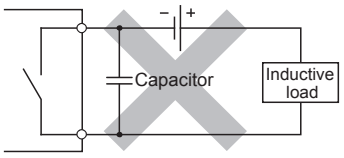
(To the next page)

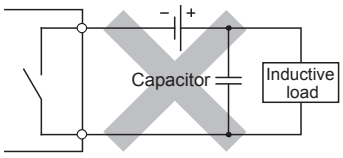
1 - 18

Circuit example		Method for selecting elements	Remarks
Varistor method		Select a cut voltage (Vc) for the varistor to meet the following condition. • Vc > power voltage × 1.5(V) • Vc > power voltage × 1.5(V) × √2 (When using AC power) This method is not effective when the Vc is too high	The recovery time delays slightly.

POINT

(1) Avoid providing contact protection circuits shown below.
These circuits are effective for preventing an arc at shut-off. However, the contact welding may occur because the charge current flows to capacitor when the contact turns on or off.
A DC inductive load is usually harder for switching than a resistor load, but if a proper protection circuit is configured, the performance will be similar to the resistor load.



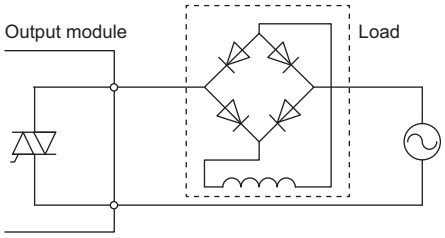


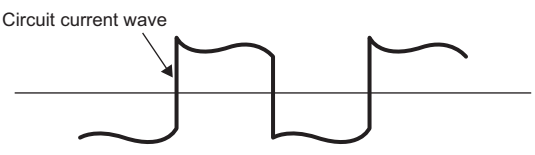
(2) A protection circuit must be provided closely to a load or contact (module). If their distance is far, the protection circuit may not be effective. Appropriate distance is within 50cm.

(7) Precautions for using the triac output module
Because of characteristics of a triac, a sudden change of voltage or current may cause unstable operations of a triac used for the triac output module.
Whether the voltage or current change causes a problem differs depending on an individual part (each triac), thus check the following when using the triac output module.

(a) Checking of the load current
When the current consumption is equal to or smaller than the minimum load current and the margin is low by using an inductive load such as a solenoid valve, a triac may not turn on or off properly. In that case, an action such as connecting a bleeder resistance is required.
For detail on actions, refer to Section 8.2.2.

(b) Precautions on a full-wave rectifier load
The load current of a full-wave rectifier load forms waves similar to rectangular waves as shown below.





1 - 19

A triac may not operate properly if the current forms rectangular waves associated with sudden current changes. To avoid it, use a load with which the load current does not form rectangular waves.

(c) Measures for connecting an inductive load

To connect an inductive load, take measures to reduce noise to the side where the load is connected as shown below.

Circuit example		Method for selecting elements	Remarks
Varistor method		Select a cut voltage (Vc) for the varistor to meet the following condition. • Vc > Power supply voltage × 1.5(V) × √2 This method is not effective when the Vc is too high.	The recovery time delays slightly.
Capacitor + Resistor method (CR method)		Refer to the following for constants of the capacitor and resistor. Note that the following values may differ depending on a nature of the load and a variation of characteristics of it. • Capacitor: 0.5 to 1 (μF) against load current of 1A • Resistor: 0.5 to 1(Ω) against power supply voltage of 1V Use a capacitor whose withstand voltage is equal to or more than the rated voltage. Use a capacitor having no polarity.	If a load is from a relay or solenoid, the recovery time delays.

(d) Measures for connecting an inductive load (when installing a contact between the load and the output terminal)

To install a contact (such as an interlock) between the load and the output terminal, take measures to reduce noise as shown below.

Though measures (varistor method, capacitor + resistor method) are normally taken to the load side, in some cases, it is more efficient to take the measures to the module side considering the contact effect.

Circuit example		Method for selecting elements	Remarks
Varistor method	• Measure taken to the load side  • Measure taken to the module side 	Select a cut voltage (Vc) for the varistor to meet the following condition. • Vc > Power supply voltage × 1.5(V) × √2 This method is not effective when the Vc is too high.	The recovery time delays slightly.

I/O combined module	AJ65SBTB1-16DT, AJ65SBTB1-32DT, AJ65SBTB1-16DT1, AJ65SBTB1-32DT1, AJ65SBTB32-8DT, AJ65SBTB32-16DT, AJ65SBTC4-16DT, AJ65SBTC1-32DT, AJ65SBTC1-32DT1, AJ65SBTW4-16DT, AJ65SBTCF1-32DT, AJ65VBTCF1-32DT1, AJ65VBTCE32-16DT, AJ65VBTCE32-32DT

(2) Modules with overload protection function and overheat protection function

Output module	AJ65SBTB1-8TE, AJ65SBTB1-16TE, AJ65FBTA2-16T, AJ65FBTA2-16TE, AJ65VBTCE3-16TE
I/O combined module	AJ65FBTA42-16DT, AJ65FBTA42-16DTE, AJ65VBTCE3-16DTE, AJ65VBTCE3-32DTE

Function	Description
Common to protection functions	1. When an overcurrent continues to flow and generates overheat, overheat protection is activated. 2. The functions are provided for protecting only the circuits inside the module. A load error may deteriorate output elements or discolour the module case or printed circuit board due to increase in temperature within the module. If a load error occurs, turn off the corresponding output immediately and eliminate the error cause.
Overload protection function	1. Protection is activated under an overload condition of 1 to 3A per point. 2. Protection is automatically reset when the load current drops to the rated value.
Overvoltage protection function	1. This function protects elements from an abrupt surge caused when a coil load is used.
Overheat protection function	1. The protection of the following modules is activated in units of two points: AJ65SBTB1-8TE, AJ65SBTB1-16TE, AJ65VBTCE3-16TE, AJ65VBTCE3-16DTE, AJ65VBTCE3-32DTE (For example, when protection is activated for either Y0 or Y1 output signals, Y0 and Y1 simultaneously turn off. When the overheat condition continues, the heat is conducted to other loads and the corresponding protections may also be activated.) For the modules except the above, the protection is activated in units of one point. 2. If protection is activated while an output signal is on, the voltage oscillates between 0V and the load voltage. When the load voltage is 24VDC, the average voltage during oscillation is approximately 7VDC. (The voltage does not oscillate when an output signal is off.) Use an external load that operates at higher than 7VDC. 3. Protection is automatically reset when the temperature falls below the preset value.

When changing the module online, connect the optional online connectors (A6CON-PWJ5P) between the connector and plugs.
7)	Connector for I/O	Connector for I/O signals.
8)	DIN rail hook	Hook to install the module to the DIN rail or connector type Metal installation fitting (option). When mounting the module to a DIN rail, push in the DIN rail hook until it clicks.
9) 10)	Mounting bracket (accessory)	Used to install the module to a control panel. (Can be attached in two different ways, 9) and 10).) Holding fixtures for screw installation are removal.

			8.4 to 150Hz	9.8m/s^2	—	
		Under continuous vibration	5 to 8.4Hz	—	1.75mm	—
			8.4 to 150Hz	4.9m/s^2	—

Operating atmosphere	No corrosive gases					
Operating altitude ∗3	0 to 2000m					
Installation location	Inside a control panel ∗5					
Overvoltage category ∗1	II or less					
Pollution degree ∗2	2 or less					

∗1 This indicates the section of the power supply to which the equipment is assumed to be connected between the public electrical power distribution network and the machinery within premises.
Category II applies to equipment for which electrical power is supplied from fixed facilities. The surge voltage withstand level for up to the rated voltage of 300V is 2500V.

∗2 This index indicates the degree to which conductive material is generated in terms of the environment in which the equipment is used.
Pollution level 2 is when only non-conductive pollution occurs. A temporary conductivity caused by condensing must be expected occasionally.

∗3 Do not use or store the programmable controller under pressure higher than the atmospheric pressure of altitude 0m. Doing so may cause malfunction. When using the programmable controller under pressure, please consult your local Mitsubishi representative.

∗4 This applies only when all waterproof connectors are being used or when waterproof caps are attached to unused waterproof connectors or pipes. (Only the AJ65SBTW□-16□ has pipes.)

∗5 The module can be used in an environment other than inside a control panel if the conditions such as the operating ambient temperature and humidity are satisfied.

∗6 For the waterproof type remote I/O module (AJ65SBTW□-16□ only), the operating ambient temperature and storage ambient temperature will be as follows.

Item		Specifications
Operating ambient temperature		0 to 45°C
Storage ambient temperature	Not wired (individual product)	-20 to 65°C
	Wired (after cable installation)	-10 to 55°C

REMARK

To ensure that the product maintains EMC and Low Voltage Directives, certain measures may be necessary. Please refer to the user's manual for the CPU module used.

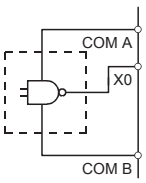
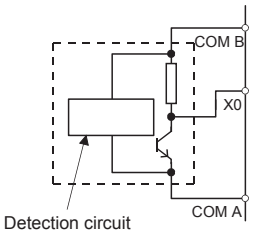
For TTL, LS-TTL, or CMOS buffer (positive common) connection



For a sensor (negative common) connection*2



* 1: Polarity to connect an external power supply for TTL, LS-TTL, and CMOS buffer (positive common) connection.
For a sensor (negative common) connection, connect the negative pole to DC5A and the positive pole to DC5B.

* 2: For connection of TTL output (source type) sensor, use a sensor with a built-in pull-up resistor or provide a pull-up resistor in the circuit.

7 HANDLING OF COMPACT REMOTE I/O MODULES

7.1 Handling and Installation Precautions

This section lists the precautions for handling and installing the compact remote I/O module for the CC-Link system.

⚠WARNING

- Do not touch any terminal or connector while power is on.
  Doing so will cause electric shock.

⚠CAUTION

- Prevent foreign matter such as dust or wire chips from entering the module.
  Such foreign matter can cause a fire, failure, or malfunction.
- Do not disassemble or modify the module.
  Doing so may cause failure, malfunction, injury, or a fire.
- Do not directly touch any conductive part of the module.
  Doing so can cause malfunction or failure of the module.
- Do not drop or apply any strong shock to the module. Doing so may damage the module.
- Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
- Tighten the terminal screw within the specified torque range.
  Undertightening can cause fire or malfunction.
  Overtightening can damage the screw, resulting in short circuit or malfunction.
- When disposing of this product, treat it as industrial waste.
- Use the module in an environment that meets the general specifications in this manual.
  Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
- Securely fix the module with a DIN rail or mounting screws. Tighten the screws within the specified torque range.
  Undertightening can cause drop of the screw, short circuit or malfunction.
  Overtightening can damage the screw, resulting in drop or short circuit.
- Shut off the external power supply (all phases) used in the system before mounting or removing a module to/from a control panel.
  Failure to do so may cause the module to fail or malfunction.

(1) Tighten the module mounting screw or terminal block screw within the following torque range. Overtightening can damage the module case.

(a) Terminal block type, one-touch connector type, or FCN connector type

Screw	Tightening torque range
Module mounting screw (M4 screw with plain washer finished round)	0.78 to 1.08N·m
Terminal block screw (M3)	0.59 to 0.88N·m
Terminal block installation screw (M3.5)	0.68 to 0.98N·m

(b) Waterproof type (AJ65SBTW□-16□)

Screw	Tightening torque range
Module top cover mounting screw (M3)	0.54 to 0.64N·m
Module front cover mounting screw (M3)	0.54 to 0.64N·m

POINT

- For a terminal and a screw, avoid adhering to oil.
  Doing so may damage the screw.
- When using two solderless terminals, place them with their backs faced.
  If not, a screw cannot be full inserted, resulting in damage to the screw.
- Tighten the terminal screw with an applicable driver.
  Failure to do so may damage the screw.

(2) A scratch-resistant film is attached on the surface of the module during transportation.
Remove the film before operation.

7 - 2

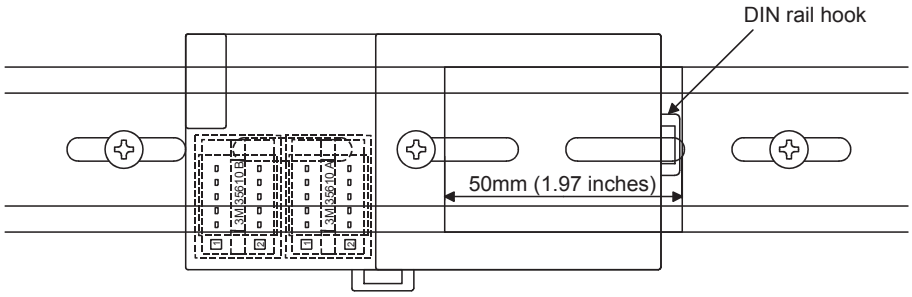
(3) Observe the following points when installing a module to a control panel using a DIN rail.

(a) Applicable DIN rail (compliant with IEC 60715)
TH35-7.5Fe
TH35-7.5Al

(b) Mounting pitch
When installing a DIN rail to a control panel, keep mounting pitches 200mm (7.87 inches) or less.

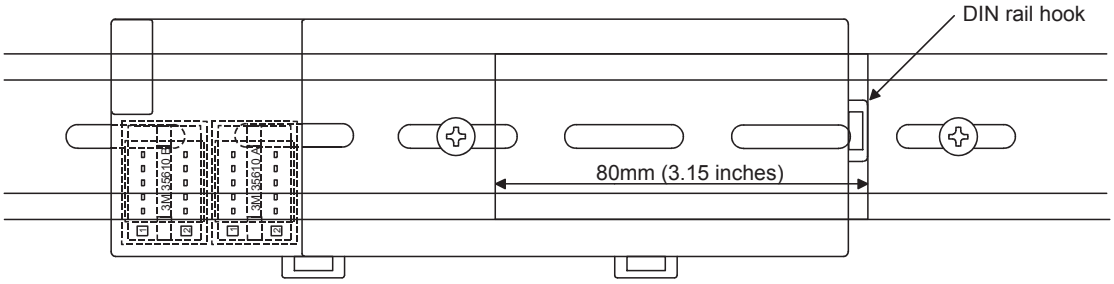
(c) Area where screws cannot used for Din rail installation
When installing the AJ65VBTCE□-16□ and AJ65VBTCE□-32□ to the DIN rail horizontally as shown below, tighten a screw so that a certain distance will be ensured between the screw and the DIN rail hook on the right side of module.
Failure to do so may cause the screw to interfere with the DIN rail hook.

1) For AJ65VBTCE□-16□
Tighten a screw keeping a distance of 50mm (1.97 inches) or more from the DIN rail hook on the right side of module.



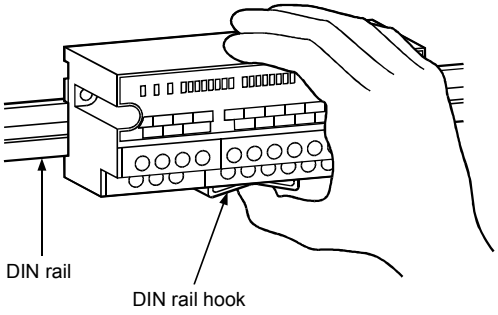
7 - 3

2) For AJ65VBTCE□-32□
Tighten a screw keeping a distance of 80mm (3.15 inches) or more from the DIN rail hook on the right side of module.

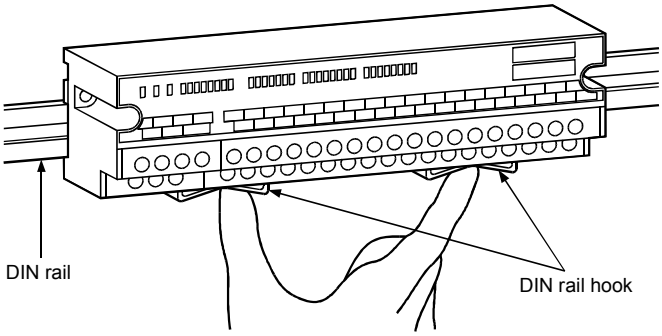


(4) When mounting the compact remote I/O module to a DIN rail, push in the DIN rail hook located at the bottom of the module until it clicks.

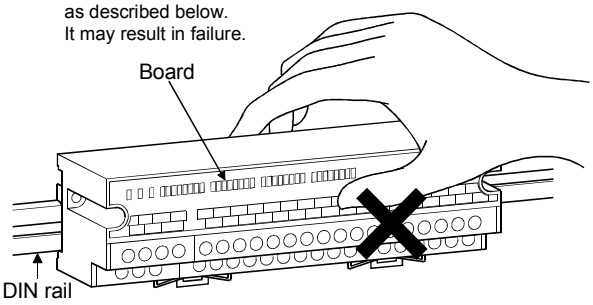
For AJ65SBTB1-8 □, AJ65SBTB1-16 □, AJ65SBTC4-16 □, AJ65SBTC1-32 □, AJ65SBTCF1-32 □, AJ65SBTB2-8 □, AJ65SBTB2N-8 □, AJ65SBTB32-8 □, AJ65VBTS □ -16□, AJ65VBTCE □ -8 □, AJ65VBTCE □ -16 □
compact remote I/O modules



For AJ65SBTB1B-16 □, AJ65SBTB1-32 □, AJ65SBTB2-16 □, AJ65SBTB2N-16□, AJ65SBTB3-16□, AJ65SBTB32-16□, AJ65VBTS□-32□, AJ65VBTCE□-32□
compact remote I/O modules

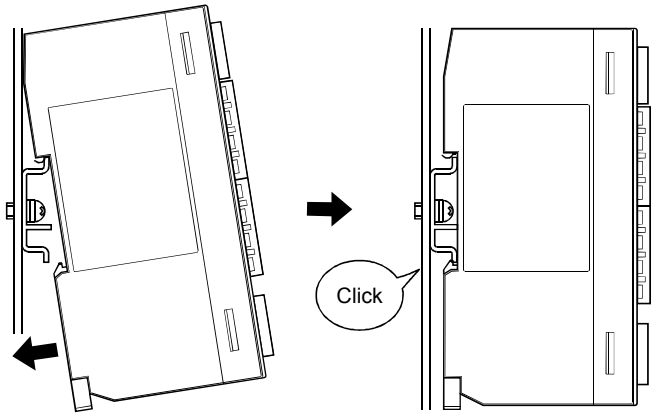


Note: Do not touch the board as described below. It may result in failure.



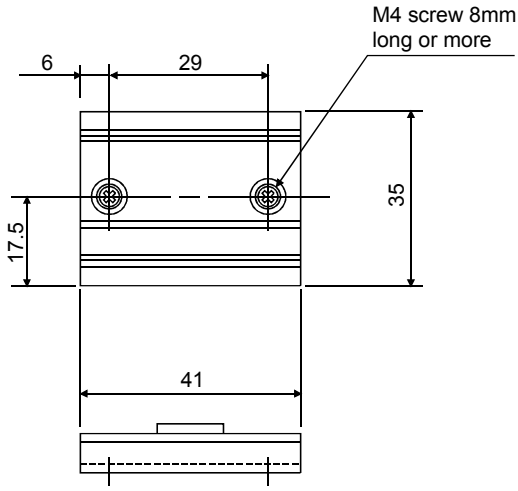
7 - 4

(5) When mounting the compact remote I/O module on the DIN rail, put its upper hook onto the fixing bracket and push the module until it clicks.

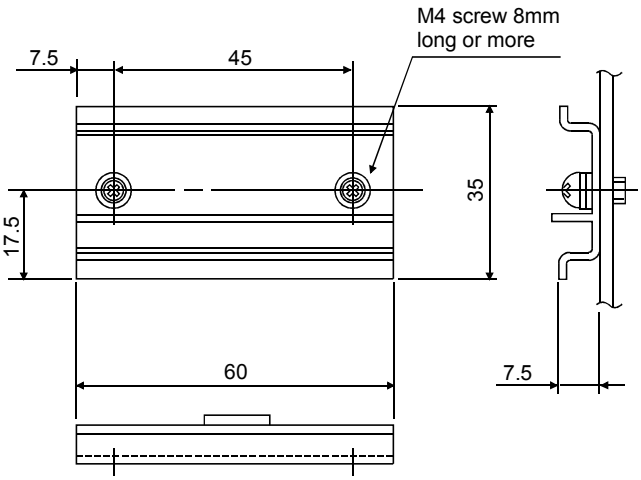


[Mounting dimensions]

(a) A6PLT-J65V1 (For module width 41mm only)



(b) A6PLT-J65V2 (For module width 60mm only)



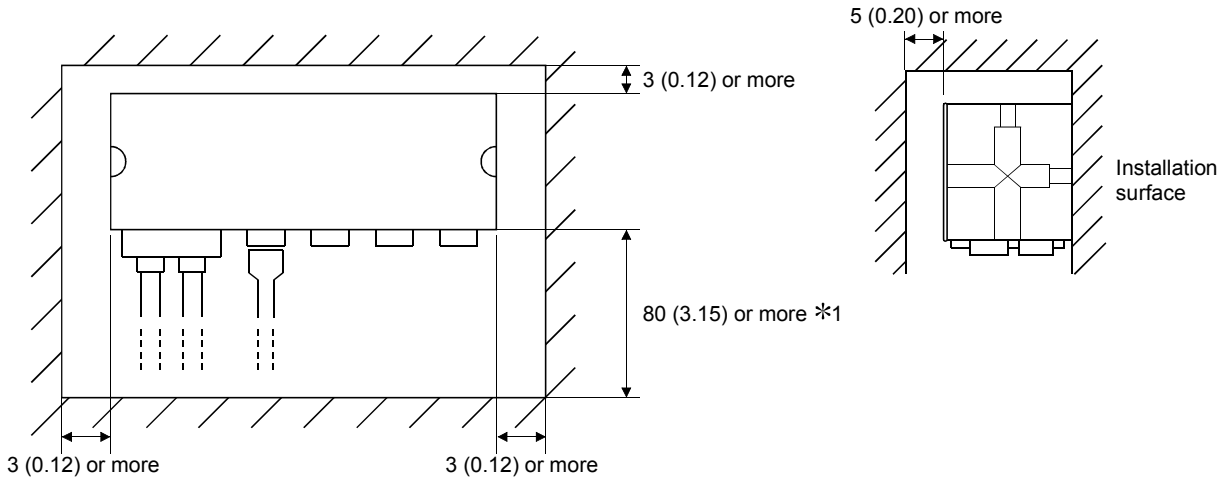
Unit : mm

(6) Do not install the compact remote I/O module to the place where:
- (a) an ambient temperature is outside the range of 0 to 55°C (0 to 45°C for the waterproof remote I/O module),
- (b) ambient humidity is outside the range of 10 to 99%RH,
- (c) condensation occurs due to a sudden temperature change,
- (d) corrosive gas or combustible gas is present,
- (e) conductive powder (such as dust and iron powder), oil mist, salinity, or organic solvent is filled,
- (f) the module is exposed to direct sunlight,
- (g) a strong electric field or strong magnetic field is generated, and
- (h) the module is subject to vibration or shock.

(7) When installing the compact remote I/O module into a panel, etc., provide 60mm (2.36 inches) or more of space between the top and bottom of the module and other structures or parts so that good ventilation and ease of operation when exchanging modules can be secured.

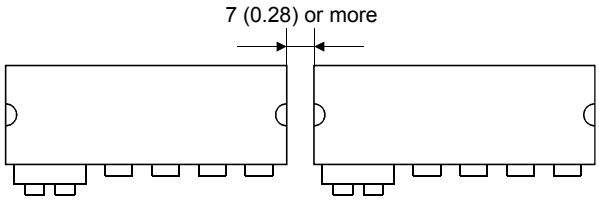
(8) Install the compact remote I/O module on a level surface.
If the surface is uneven, unnecessary force is applied to the printed circuit board, causing malfunction.

(9) When installing the waterproof-type remote I/O module, provide the space shown in the figure below between the top and bottom of the module and other structures or parts so that good ventilation can be secured and that interference and application of load on the waterproof connector can be prevented.
When connecting two modules in parallel, secure 5mm (0.2 inches) of space between them.



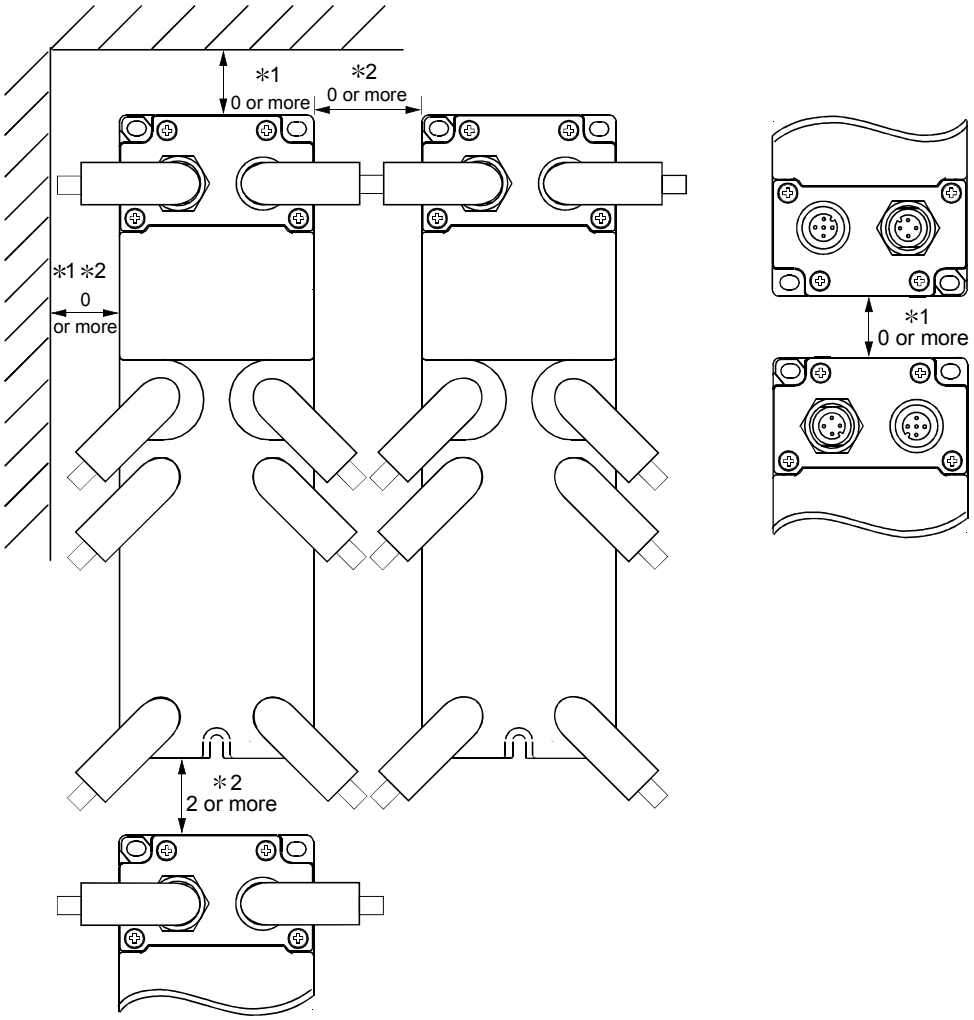
*1 Provide a space so that no load is applied to the cable (the space differs depending on the waterproof connector used).

<When two modules are installed in parallel>



Unit : mm (inch)

(10) If a waterproof cap is being installed on the low profile waterproof type remote I/O module, in order to improve ventilation and also to prevent interference, as well as to prevent a load from bearing on the waterproof connector, all the distances shown in the following figures between the module's side surfaces and the structure or parts.



∗1 If you disconnect and connect the communications adapter, set the operating distance using a screwdriver, etc.

∗2 If you are using a right angle type waterproof plug or Y branch connector, set a distance where no load will be brought to bear on the cable.

(11) When installing the sensor connector (e-CON) type modules in parallel, take intervals between the modules as shown below.
(The interval is required for the size of a DIN rail hook or mounting brackets.)

Installation method of the module	Installation orientation of the module	Interval*3
Using a DIN rail*1	Basic, Upside down (vertical installation)	5mm
	Basic, Upside down (horizontal installation)	5mm
Using screws*2	Basic, Upside down (vertical installation)	5mm
	Basic, Upside down (horizontal installation)	15mm

* 1 This is the case when a DIN rail is installed horizontally. Do not apply this interval to the AJ65VBTCE□-8□.
* 2 This is the case when mounting brackets are attached on the top and bottom sides of the module. If the brackets are attached on the right and left sides of the module, apply the intervals reversely. (The interval for the vertical installation is 15mm and the interval for the horizontal installation is 5mm.)
* 3 The interval indicates the distance from the modules that are installed on the either side.

(12) When handling the DIP switch, observe the following:
(a) Use a compact driver.
Do not handle the DIP switch with a mechanical pencil or a sharp, such as a pair of tweezers and a needle.
If the lead or lead powder of a mechanical pencil enters into the switch, a failure may result. Or if it drops into a circuit board, an electrical problem may result.
Using a sharp may damage the switch, resulting in failure.
(b) Slide the switch lever one by one horizontally to the intended direction.
If the driver pushes the switch lever at an angle or from the right above, the switch may be damaged or transformed due to the pressing load.

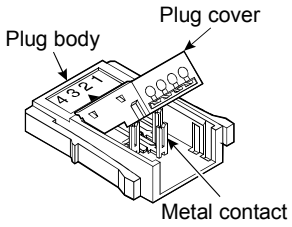
7.2.3 Wiring procedures for the one-touch connector

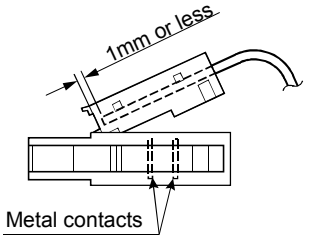
This section describes the wiring procedures for the one-touch connector of the one-touch connector type or connector type compact remote I/O module.



↓

1) Check the connector.
Check that a plug cover is attached to the plug.

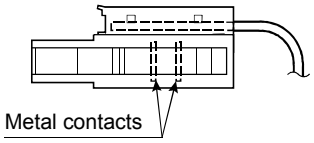
Note: Do not press the plug cover firmly into the plug before a cable is inserted.
Once crimped, the plug can no longer be used.



↓

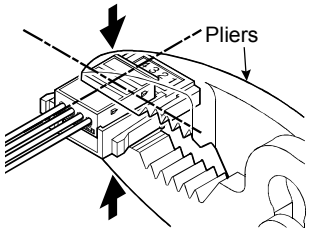
2) Insert a cable. (＊1)
Lift the end of the plug cover and insert a cable until it reaches the other end of the cover (within 1mm from the other end).
Failure to do so may cause an improper crimping.

Note: When inserting the cable, prevent the cable from sticking out from the plug cover end.



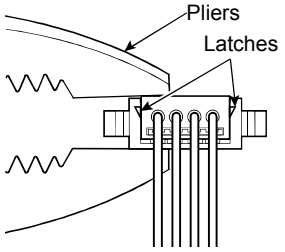
↓

3) Set the plug cover.
After the cable is inserted, put down the plug cover and set it to the position where the metal contacts fit into the cover.



↓

4) Crimp the plug cover into the plug.
Hold the center of the plug cover with pliers and press it vertically into the plug.



↓

5) Press the latches into the plug.
After crimping, press the latches located at both ends of the plug cover into the plug.
Check that the cover is fixed to the plug with the latches.

7.6 Attaching and Removing the Protective Cover for the Compact Remote I/O Module

Covering the front of CC-Link system compact remote I/O module with a protective cover can prevent the following accidents:

- Improper contact to the terminal block or connector.
- Module malfunction resulted from connector drop.

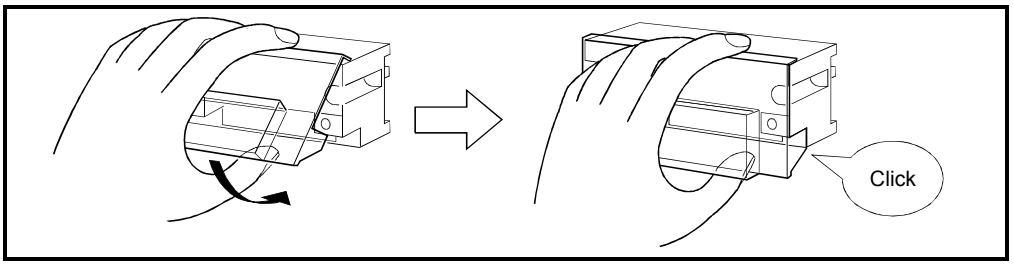
For the model name of the protective cover for the compact remote I/O module, see Section 1.5.

Follow the procedure illustrated below to mount the protective cover on the module.

(1) In the case of A6CVR-8/16/32

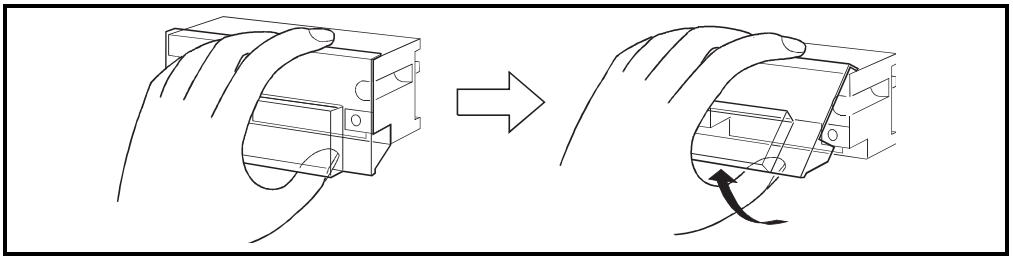
<How to mount>

Hook the top of the protective cover onto the top of the remote I/O module, then push the lower part of the cover toward the module until you hear a click sound.



<How to remove>

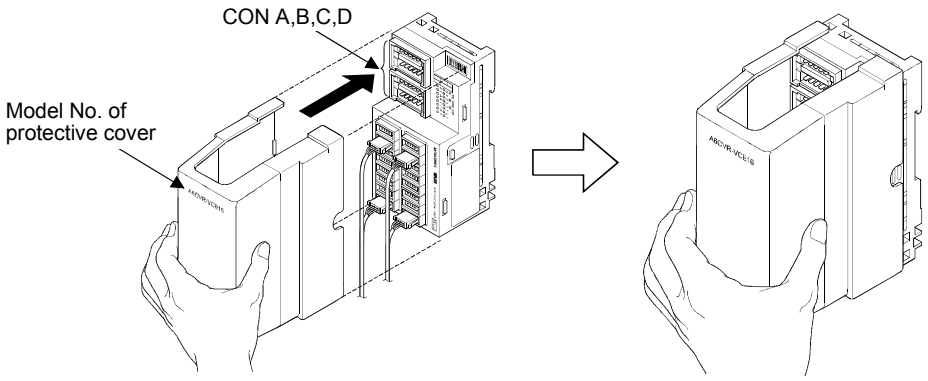
Place your thumb under the protective cover and pull it upwards.



(2) In the case of A6CVR-VCE8/16

<How to mount>

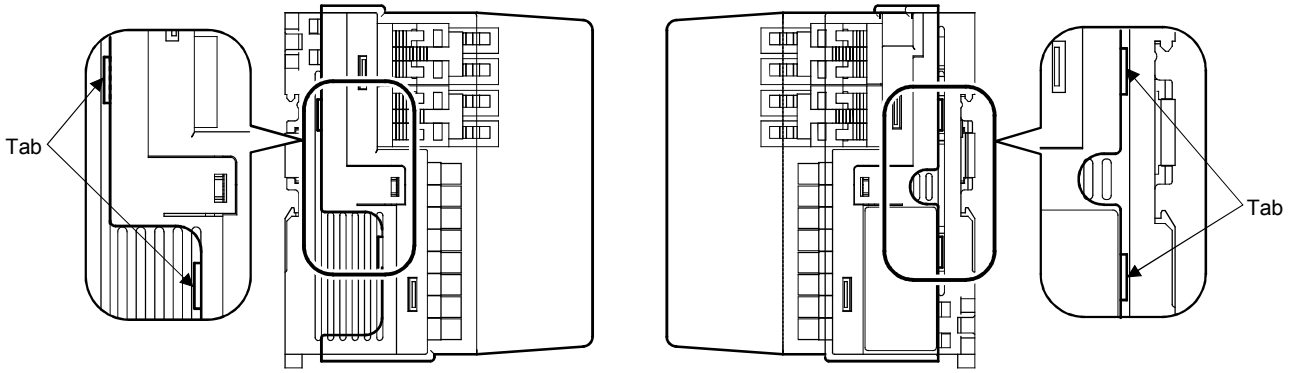
Confirm the orientation of the protective cover as shown in the diagram below. Then, attach the cover straight to the module as shown by the arrow and push in securely until it stops.



∗: Attach the protective cover, keeping its model No. and the CON A, B, C and D in the same orientation.
Otherwise, the cover cannot be attached.

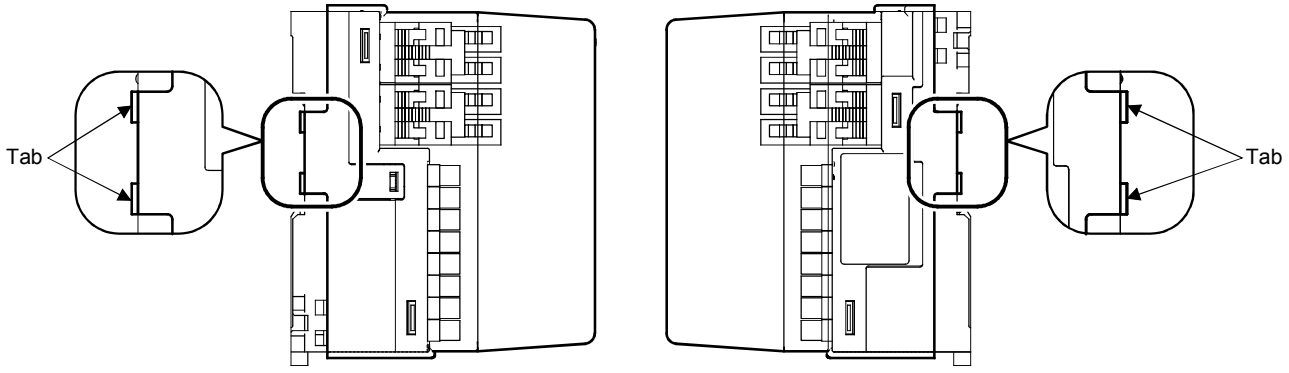
Securely fix tabs of the protective cover to the groove of the module as shown below.
Note that the fixing tab positions vary with the protective cover used.

In the case of A6CVR-VCE16



(Left side) (Right side)

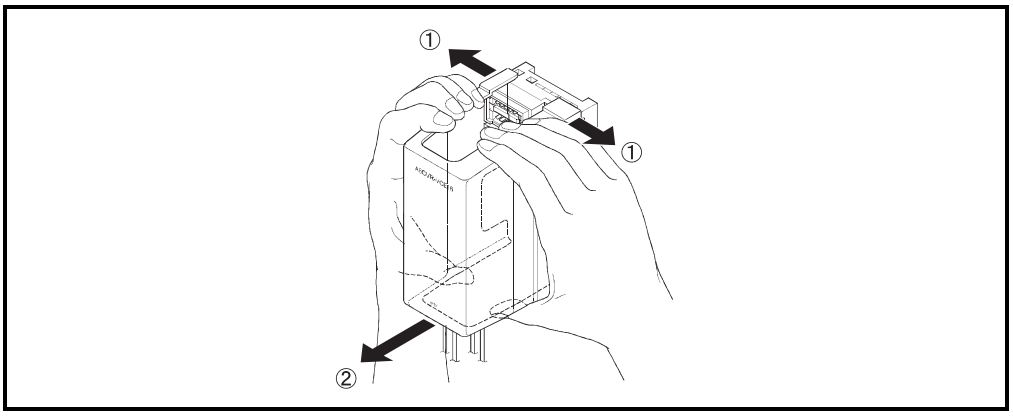
In the case of A6CVR-VCE8



(Left side) (Right side)

<How to remove>

Extend the width of protective cover slightly as shown by the arrow 1). Then, pull it out vertically from the module as shown by the arrow 2).

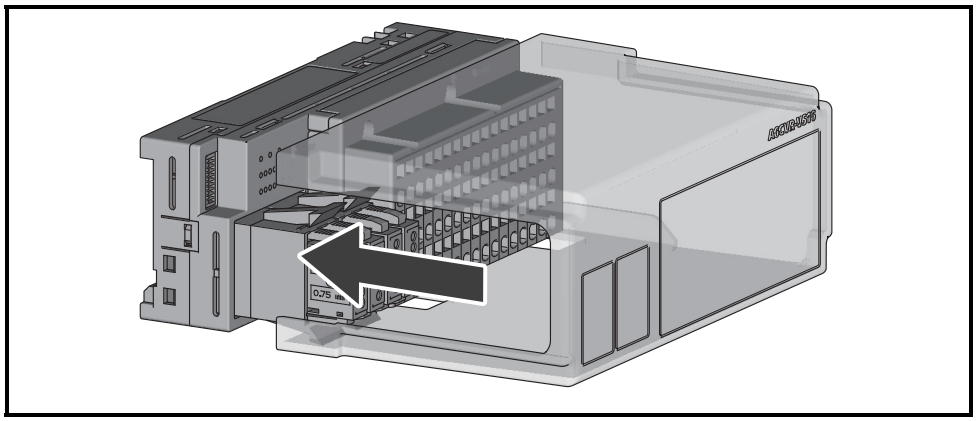


7 - 23

(3) In the case of A6CVR-VS16

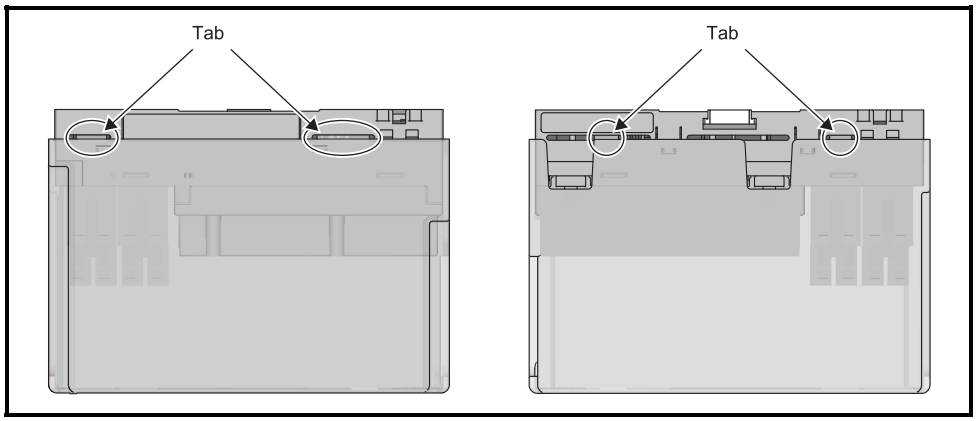
<How to mount>

Attach the protective cover as shown below.



Attach the protective cover so that the online connector for communication on the module is opposite to the model name of the protective cover. Do not attach the cover in the direction other than that shown above.

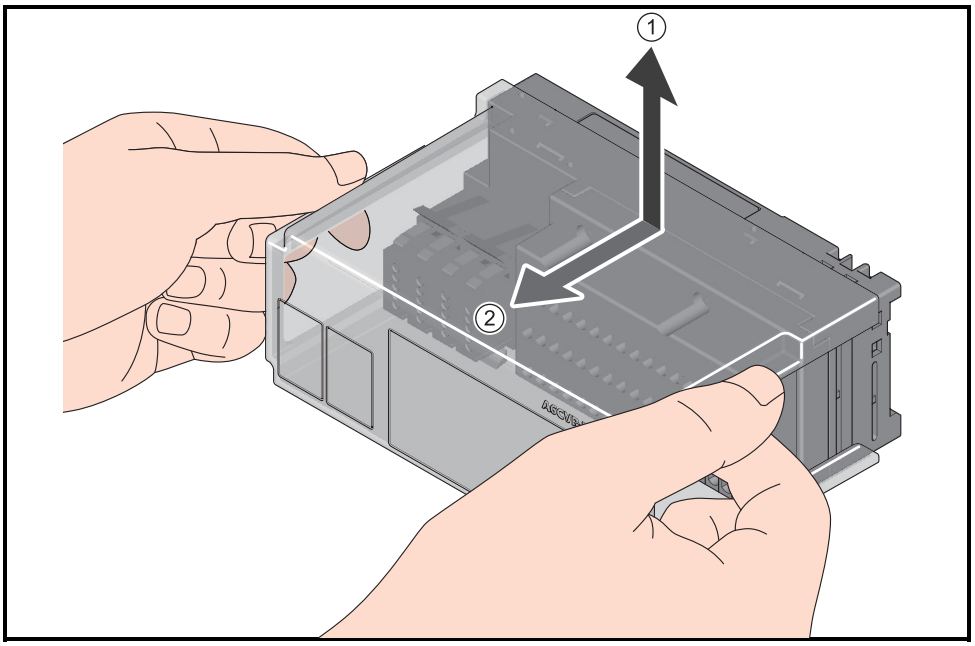
Securely engage tabs of the protective cover with the grooves on the module as shown below.
Note that the locations of tabs vary depending on the protective cover used.

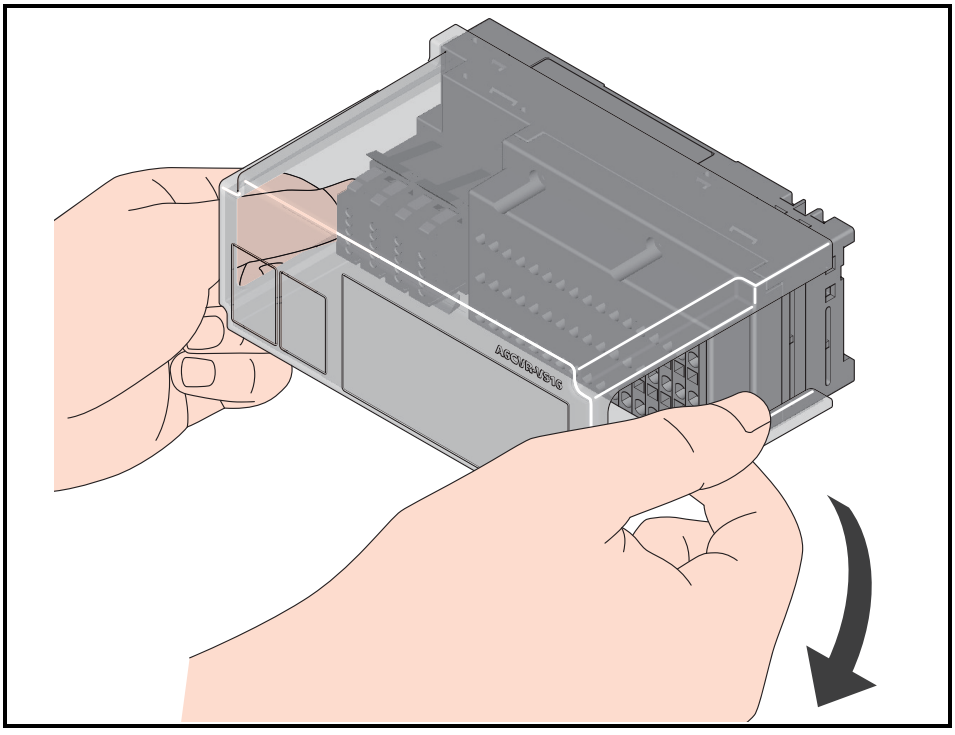


(Top part) (Bottom part)

<How to remove>

Hold the both ends of the protective cover (top part) as shown below.
To disengage the tabs from the module, lift up the protective cover in the direction of arrow [1], and pull it in the direction of arrow [2].



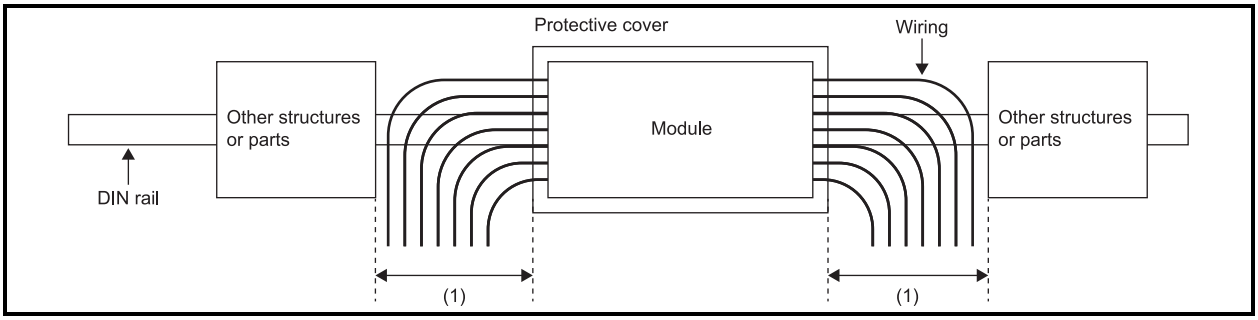


Hold the both ends of the protective cover (bottom part), slightly push it down, and pull it in the direction of arrow [2] as you did for the top part of the cover.

7 - 25

<Precautions for installing the module>

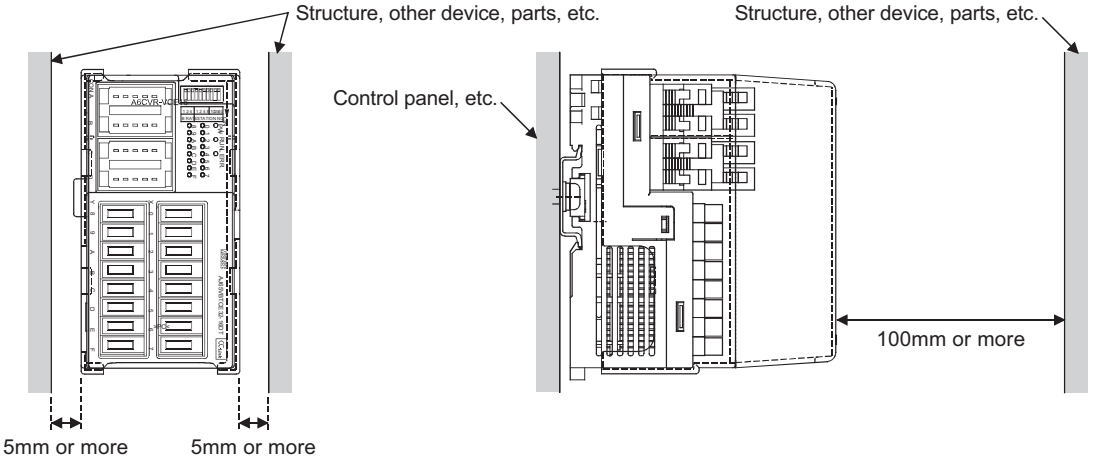
Using the module with the A6CVR-VS16 (protective cover) attached requires a configuration where cables come out from both sides of the module. Therefore, in such a case, have enough spaces between the module and other structures or parts considering the bending radius of the cables used.



(1) Distance determined considering the bending radius of the cables

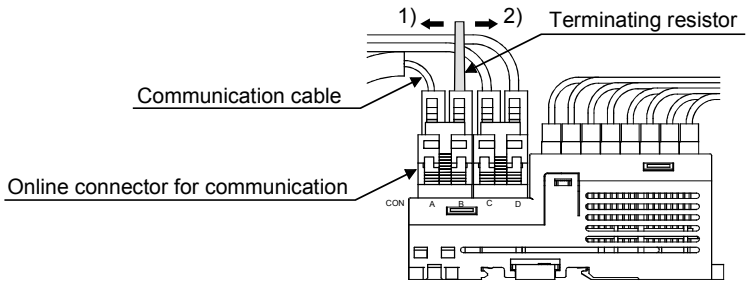
POINT

(1) When attaching the protective cover, ensure the space of 50mm or more between the target module and the modules on the right and left sides. Also, ensure the space of 100mm or more over the upper part of the module, so that the cover can be pulled upward.



(2) Fix the wiring with a clamp or similar parts. Failure to do so may apply force to the protective cover, resulting in it falling from the module. In addition, the wiring cable may be damaged.

(3) When attaching a one-touch connector plug with terminating resistor (A6CON-TR11(N)) together with an online connector for communication (A6CON-LJ5P), follow the procedure provided below.
Failure to do so may cause the terminating resistor, protective cover and communication cable to interfere with each other.
- Tilt the terminating resistor toward 1) or 2) as shown in the diagram below, and then attach the protective cover.
- Connect the one-touch connector plug with terminating resistor to CON B.



7.7 Connection Method of CC-Link Dedicated Cable

This section describes how to connect the compact remote I/O module to the master module using CC-Link dedicated cables.

⚠WARNING

- Shut off the external power supply (all phases) used in the system before wiring. Failure to do so may result in electric shock or damage to the product.
- After wiring, attach the included terminal cover to the module before turning it on for operation.
  Failure to do so may result in electric shock.
- Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal block screw. Failure to do so may cause the module to fail or malfunction.

⚠CAUTION

- Do not install the control lines or communication cables together with the main circuit lines or power cables.
  Keep a distance of 100mm (3.9 inches) or more between them.
  Failure to do so may result in malfunction due to noise.
- Individually ground the FG terminal of the programmable controller with a ground resistance of 100Ω or less.
  Failure to do so may result in electric shock or malfunction.
- Tighten any unused terminal screws within the specified torque range (0.42 to 0.50N•m).
  Failure to do so may cause a short circuit due to contact with a solderless terminal.
- Use applicable solderless terminals and tighten them within the specified torque range. If any solderless spade terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
- Check the rated voltage and terminal layout before wiring to the module, and connect the cables correctly.
  Connecting a power supply with a different voltage rating or incorrect wiring may cause a fire or failure.
- Securely connect the cable connectors.
  Poor contact may cause malfunction.
- Place the cables in a duct or clamp them.
  If not, dangling cable may swing or inadvertently be pulled, resulting in damage to the module or cables or malfunction due to poor contact.
- Do not install the control lines or communication cables together with the main circuit lines or power cables.
  Failure to do so may result in malfunction due to noise.
- When disconnecting the cable from the module, do not pull the cable by the cable part.
  For the cable with connector, hold the connector part of the cable.
  For the cable without connector, loosen the screw first and remove it.
  Pulling the cable connected to the module may result in malfunction or damage to the module or cable.

7.8.2 Procedure for wiring the spring clamp terminal block

This section describes the procedure for connecting a cable to the spring clamp terminal block remote I/O module.

(1) Precaution for connecting or disconnecting cables

(a) When inserting two wires into the circular shaped hole of the spring clamp terminal block, use the TGWV TC1.25-T9 (manufactured by NICHIFU Co., Ltd.). Inserting two or more wires without using the TGWV TC1.25-T9 may result in a poor contact to the spring clamp terminal part.

(b) Strip the wire according to the specification. If the wire strip length is too long, the exposed conductive part may cause electric shock or short circuit. If the wire strip length is too short, it may result in a poor contact to the spring clamp terminal part.

(c) When using a spring clamp terminal block tool, follow the instruction below. Failure to do so may cause damage of the spring clamp terminal part or the terminal block resin part.

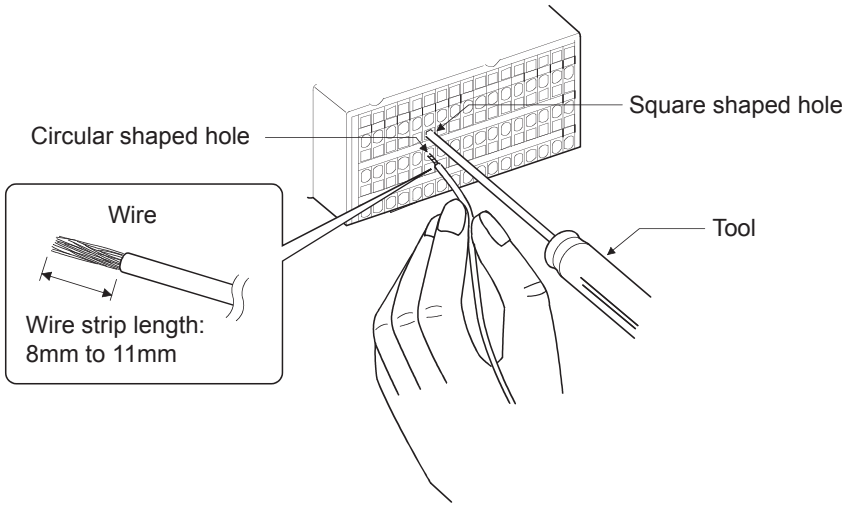
- Use a dedicated tool for a spring clamp terminal block.
- Do not insert the wire or the bar solderless terminal before inserting the tool into the square shaped hole.
- Insert the tool vertically into the hole.

(2) Connecting a cable

(a) Insert the tool vertically all the way inside the square shaped hole of the remote I/O module.

(b) Insert the wire or the bar solderless terminal into the circular shaped hole, and remove the tool from the hole.

(c) Check that the wire or the bar solderless terminal is firmly clamped by pulling it lightly.



(3) Disconnecting a cable

(a) Insert the tool vertically all the way inside the square shaped hole of the remote I/O module.

(b) Pull the wire or the bar solderless terminal out of the hole.

8.2 Examples of Errors for Compact Remote I/O Modules

This section explains examples of errors that occur in the input circuit, and the appropriate corrective actions.

8.2.1 Errors occurring in the input circuit and corrective actions

Examples of errors that occur in the input circuit and corrective actions are explained below:

	Error status	Cause	Corrective action
Example 1	Input signals do not turn off.	• Activation via the LED display switch. 	• Connect an appropriate resistor as shown below so that the current flowing along the input module becomes lower than OFF current.  * A calculation example used to obtain the resistance value to be connected is shown on the following page.
Example 2	Input signals do not turn off.	• Sneak current due to the use of two power supplies 	• Use only one power supply. • Connect a diode to prevent a sneak current as shown below. Example 3	Input signals do not turn off.	• Input switch leakage current (driving with a contactless switch). 	• Connect the appropriate resistor so that the terminal-to-terminal voltage of the input module is below the OFF voltage value.  0.1 to 0.47μF + 47 to 120Ω (1/2W) is recommended for the CR constant.
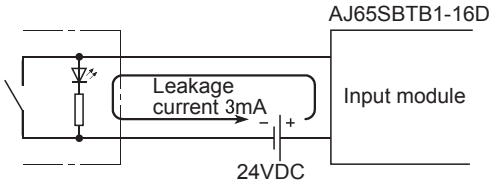
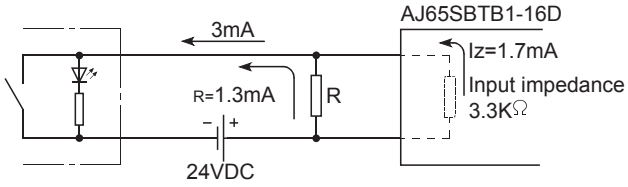
Example 4	Input signals do not turn off.	• Driving using a limit switch with neon lamp. 	• Same as Example 3. • Or, create a completely separate display circuit.
Example 5	Input signals do not turn off.	• Leakage current due to line capacity of the wiring cable. The line capacity "C" of a twisted pair wire is about C=100PF/m. 	• Same as Example 3. • However, this problem will not occur if the power supply as shown below is provided at the input device side. 
<Sample calculation for Example 1>

When a switch with LED indicator, giving leakage current of 3mA at maximum when 24VDC power is supplied to the AJ65SBTB1-16D



(1) 1.7mA or less OFF current of the AJ65SBTB1-16D is not satisfied. Hence, connect a resistor as shown below.



(2) Calculate the resistance value R as shown below.
To satisfy 1.7mA or less OFF current of the AJ65SBTB1-16D, connect a resistor which flows 1.3mA or more.

I_R: I_Z=Z (Input impedance): R

$$R \leqq \frac{I_Z}{I_R} \times Z \text{ (Input impedance)} = \frac{1.7}{1.3} \times 3.3 = 4.31[k\Omega]$$

Supposing that the resistance R is 3.9kΩ, the power capacity W of resistor R is:
W = (Input voltage) 2 ÷ R = 26.42 ÷ 3900 = 0.179 (W)

(3) Connect a resistor of 3.9 (kΩ) and 1 to 2 (W) to a terminal which may cause an error, since the power capacity of a resistor is selected so that it will be 3 to 5 times greater than the actual power consumption.

(4) Also, OFF voltage when resistor R is connected will be as follows.

$$\frac{1}{\frac{1}{3.9[k\Omega]} + \frac{1}{3.3[k\Omega]}} \times 3[mA] = 5.36[V]$$

This satisfies 6V or less OFF voltage of AJ65SBTB1-16D.

8.2.2 Errors occurring in the output circuit and corrective action

Examples of errors that may occur in the output circuit and the respective corrective action are described below.

(1) When AJ65SBTB1-16T or AJ65SBTB1-32T is used

<table>
<tr><th></th><th>Condition</th><th>Cause</th><th>Corrective action</th></tr>
<tr><td>Example 1</td><td>When an LED is connected as a load, sometimes the LED dimly lights up even when the output module is turned off.
(Example) LED push button by Izumi Electric, Co.: ALFN22211DNR
 </td><td rowspan="2">For the output modules listed below, the output module specification and the leak current specification value during OFF are 24VDC 0.5A and 0.25mA, respectively (the leak current during OFF is specified as above since an MOS with a built-in protection function and PET transistor output are used.)
<Applicable modules>
AJ65SBTB1-16T,
AJ65SBTB1-32T</td><td>Connect a resistor with 5 to 50kΩ in parallel to the load LED.</td></tr>
<tr><td>Example 2</td><td>When a segment LED display device is connected as a load, the display contents sometimes become incorrect.
(Example) M7E digital display unit (height of character 14mm) by Omron, Co.: M7E-01DBN2
 </td><td>Connect a pull-up resistor with 5 to 50kΩ and 0.5(W) between the 24VDC power supply and the output module output.</td></tr>
</table>

(2) When AJ65SBTB2(N)-8S or AJ65SBTB2(N)-16S is used

	Condition	Cause	Corrective action
Example 1	Excessive voltage is applied to the output OFF load.	• The load is half-wave rectified internally. (Some solenoids do this process.)  • When the polarity of the power supply is [1], C is charging. When the polarity is [2], the voltage charged in C + power supply voltage is applied to both ends of D1. The maximum value of the voltage is about 2.2E.	• Connect a resistor of several tens KΩ to several hundreds KΩ to both ends of the load. When this type of method is used, no problems will occur in the output elements, but the diode that is built in the load may deteriorate and may be damaged. Example 2	The load is not turned OFF. (Triac output)	• Leakage current due to built-in surge suppressor. 	• Connect a resistor to both ends of the load. Caution is required when the wiring distance from the output card to the load is long, since there may be leakage current due to the line capacity. Example 3	Time limit changes when the load is a CR type timer. (Triac output)		• Drive the relay first, and then drive the CR type timer at that contact. Caution is required as indicated in Example 1 since the internal circuit may be half-wave rectified depending on the timer.  Calculate the resistor constant according to the load.

	Condition	Cause	Corrective action
Example 4	The load is not turned OFF. (Triac output)	• If the load current is insufficient (lower than 25mA), the triac does not operate, causing the load current to flow into a phototriac as shown below. If an inductive load is connected in this condition, the load may not turn off because surge at the time of off is applied to the phototriac. 	• Connect a resistor to both ends of a load so that the load current is higher than the minimum load current. 
8 - 7

(3) When AJ65AJ65SBTB1-8T, AJ65SBTB2-8T, AJ65SBTB1-16T, AJ65SBTB2-16T, AJ65SBTB1-32T, AJ65SBTC1-32T, AJ65SBTB32-8DT, AJ65SBTB1-16DT, AJ65SBTB1-16DT1, AJ65SBTB32-16DT, AJ65SBTB1-32DT, AJ65SBTB1-32DT1, AJ65SBTC4-16DT, AJ65SBTC1-32DT, AJ65SBTC1-32DT1, or AJ65SBTW4-16DT is used

	Condition	Cause	Corrective action
Example 1	The load does not turn Off.	When the load built into the capacitor is connected to the external load, a resonance may occur due to the inductor of the wiring and the load of the capacitor. This may lead to reverse current in output transistor. Due to the reverse current, the protection circuit for output transistor might operate, and the outputs might not be turned on. Note: Such as SSR (Solid state relay) may incorporate a capacitor for countermeasures against noise, etc. When the situation above occurs, confirm if a capacitor is incorporated to the manufacturer. 	• Install fast recovery diode (1A, 100V or more) in series with the external load.

8 - 8

(4) When output module, combined module is used

	Condition	Cause	Corrective action
Example 1	When the external power supply turns on, the load turns on for a moment.	Erroneous output due to the stray capacitance (C) between collector and emitter of photocoupler. (There is no erroneous output at normal load. An erroneous output may occur at high sensitivity load (such as solid state relay))  (1) If the external power supply is turned on precipitously, Ic current flows due to the stray capacitance (C) between collector and emitter of photocoupler. (2) Ic current flows to the next stage of transister Tr1 gate and Y0 output turns on by 100μs 	(1) When the external power turns ON/OFF, check that the external power supply rising edge must be 10ms or more, and switch the SW1 to the primary side of external power supply.  (2) When switching to the secondary side of the external power supply is required, the external power supply rising edge connected a condenser must be slow, and measured 10ms or more. Sink output  Source output  * The measures are ineffective in the following modules due to the characteristic of the external power supply circuit • AJ65SBTB1-8TE • AJ65SBTB1-16TE R1: Several tens of ohms Power capacity ≧ (external power supply current[*1])^2 × resistance value × (3 to 5)[*2] C1: several hundreds of microfarads 50V *1 Refer to consumption current of the external power supply for modules used in this manual. *2 Select the power capacity of resistance to be 3 to 5 times lager than the actual power consumption. (Example) R1=40 Ω, C1=300 μF Use the below expression to calculated a time constant C1 × R1=300 × 10^{-6} × 40 =12 × 10^{-3}s =12ms

	Condition	Cause	Corrective action
Example 2	The load which was turned OFF is turned ON for a moment at power-off. (Transistor output)	The load [2] which was turned OFF may be turned ON due to back electromotive force at the time of power-off [1] if an inductive load is used.  	Take action in the following (1) or (2). (1) To prevent the generation of the back electromotive force, connect diode in parallel with load where the back electromotive force has been generated. Source output [3]  Sink output [3]  (2) Install a diode between the positive and negative external power supply to allow an electric current to pass another current path. When the corrective action shown in the example 1 is taken simultaneously, the diode must be installed in parallel with the C1 and R1.  * The measures are ineffective in the following modules due to the characteristic of the external power supply circuit • AJ65SBTB1-8TE • AJ65SBTB1-16TE  D1: Reverse voltage VR (VRM)…*1, Forward current IF (IFM)…*2 *1 Approximately 10times higher than the rated voltage in the specifications Example: 24VDC→Approximately 200V *2 More than twice as much as the maximum load current (common) in the specifications Example: 2A/1 common→4A or more

8 - 10

	Condition	Cause	Corrective action
Example 3	The load operates due to powering on the external power supply. (transistor output)	The polarity of the external power supply is connected in reverse.  When the polarity is connected in reverse, current may flow across an output element protection diode.	Connect the polarity correctly.
Example 4	When an output is turned on, a load connected to the other output is also turned on. (transistor output (source type))	If the wire connecting 0V of an external power supply and a common of a load is cut off or disconnected, the load connected to Y1 is also turned on due to a parasitic circuit of the output element that is off.  If a current keeps flowing under the above condition, a failure may occur.	Connect the external power supply and loads correctly. To prevent the condition described on the left, connect a diode to each output terminal as shown below.

Appendix 2 CC-Link Versions

There are two versions for CC-Link: Ver.1.00 and Ver.1.10.

(1) Difference between Ver.1.00 and Ver.1.10

The original CC-Link version is Ver.1.00 and there are restrictions on the station-to-station cable length. The improved version is Ver.1.10 and there is no restriction on the station-to-station cable length (20cm or longer, in any case).
For the maximum overall cable distance of Ver.1.10, refer to the user's manual for the master/local module used.
To enable the station-to-station cable length of 20cm or longer, the following conditions must be met.

- All modules connected in the CC-Link system are Ver.1.10-compatible modules.
- Ver.1.10-compatible CC-Link dedicated cables are used in the entire system.

POINT

In a system where both Ver.1.00- and Ver.1.10-compatible CC-Link modules are connected, the specifications of Ver.1.00-compatible module are applied for the maximum overall cable distance and station-to-station cable length.
For the maximum overall cable distance and station-to-station cable length of Ver.1.00, refer to the user's manual for the master/local module used.
